TROUTDALE, OREGON**

Dear Mr. Galloway:

We are pleased to present four copies of the Hazardous Building Material Survey report for the subject site. In summary, there were asbestos-containing materials found at both the City of Troutdale property and the Eastwind Development property. These materials would need to be abated prior to demolition.

City of Troutdale: asbestos-containing floor tile and mastic in the building between the aeration basin and the clarifiers; asbestos-containing gasket on one of the aboveground storage tanks located adjacent to the Parks and Facilities office.

Eastwind Development: asbestos-containing joint compound on drywall wallboards in the abandoned office of the large warehouse; asbestos-containing gasket in the boiler room of the large warehouse; asbestos-containing fire door insulation in the central portion of large warehouse.

Lead-containing paint was detected in numerous samples across both properties. The results ranged from 70 to 94,000 milligrams per kilogram (mg/kg) lead. The highest lead result for the City of Troutdale property was 500-mg/kg. A core sample collected from the location of the "worst case" lead result on the Eastwind Development property (94,000-mg/kg) had 5.79 milligrams per liter (mg/l) leachable lead, which is only slightly above the hazardous waste characteristic of 5 mg/l. Even though the threshold value was exceeded for this sample, it is our opinion that the sampling methodology has a high bias toward an elevated result. We believe that building debris will likely be

accepted as non-hazardous construction and demolition debris upon proper arrangements with a Subtitle D Solid Waste Landfill.

We trust the information presented in this report meets your needs at this time. We appreciate this opportunity to provide our services to you. Should you require additional information or have any questions regarding this report, please contact us at (503) 644-9447.

Sincerely,

KLEINFELDER, INC.

1.0 INTRODUCTION

On March 13, 2006, the City of Troutdale authorized Kleinfelder to conduct a Hazardous Building Material Survey of several buildings owned by the City of Troutdale and Eastwind Development, LLC, on NW 257th Way in Troutdale, Oregon (Figures 1 and 2). The City of Troutdale and Eastwind Development proposes to demolish existing site buildings for future development. The scope of work was described in Kleinfelder's proposal, 6050PROP/POR5P018, dated January 30, 2006.

The purpose of the project was to evaluate building materials in the site buildings for the presence, location, and quantity of asbestos, the general extent of lead-containing paint coatings, and mercury/polychlorinated biphenyl-containing light fixtures.

Site Name: City of Troutdale & Eastwind Development LLC Parcels
Site Address: 410 NE 257th Way; Tax Lot 400; City of Troutdale
320 NE 257th Way; Tax Lot 500; City of Troutdale
302 NE 257th Way; Tax Lots 100, & 600; Eastwind Development

1.1 Scope of Work

Asbestos: Kleinfelder conducted a visual survey of the building materials suspected to contain asbestos and developed a limited homogeneous materials list. The asbestos survey was limited to non-destructive sampling of building materials that were readily accessible. Fifty-seven bulk samples were collected for polarized light microscopy (PLM) analysis.

Lead-Containing Paint Coatings: Kleinfelder collected 36 paint chip samples for lead analysis by Atomic Absorption of the predominant interior and exterior paint coatings. The collection of paint chip samples required scraping the paint from an approximately 1 by 1-foot area at each location. This scope of work did not include re-painting the sampling locations. One core sample was collected of the paint+substrate at the location of the worst-case total lead result for lead analysis by Toxicity Characteristic Leaching Procedure (TCLP). The purpose of the sample and analysis is to evaluate whether the construction debris (that includes lead-containing paint) would be considered hazardous waste.

Polychlorinated Biphenyl-Containing and Mercury-Containing Fixtures: During Kleinfelder's survey of the subject building, Kleinfelder looked for fluorescent light fixtures that could have PCB-containing light ballasts and fluorescent light tubes (with silver ends) that are generally considered to contain mercury vapor. Kleinfelder also looked for mercury-containing switches.

Building plans were not available for this assessment.

1.2 Background

Kleinfelder conducted a Phase I Environmental Site Assessment (Phase I ESA) and a Phase II ESA for the subject site. These reports are presented under separate cover.

2.0 FINDINGS & CONCLUSIONS

Asbestos-Containing Materials

Building materials that have been found to contain asbestos through analysis are designated as *friable* or *non-friable*. These designations determine how these materials will be managed, abated, and disposed. Friable asbestos-containing materials (ACMs) have a greater potential than non-friable ACMs of becoming a health hazard if the material is damaged or disturbed. Whether ACMs are friable or non-friable, the materials must be abated before they are disturbed for renovation or demolition. There are some exceptions for non-friable materials that can not be rendered friable through demolition processes (i.e., roofing mastic).

Various regulatory agencies have jurisdiction over projects dealing with the abatement of ACMs. Building materials that contain greater than 1% asbestos are regulated by the U.S. Environmental Protection Agency (EPA) and Oregon Department of Environmental Quality (DEQ). The DEQ enforces the U.S. EPA NESHAPS¹ rule with respect to releases of asbestos to the environment. Oregon Occupational Safety and Health Administration (OSHA) regulates ACMs with greater than 1% asbestos.

Asbestos-Containing Materials—Eastwind Development Property

Asbestos was detected in the joint compound applied to the drywall wallboards in the small office connected to the large warehouse. The overall composite result was less than 1%. The joint compound layer result was 2% asbestos. Kleinfelder assumes that the finished drywall wallboards in this office have asbestos-containing joint compound. Additionally, a sample of an exposed gasket in the boiler room contained 50% asbestos. Gaskets used in high heat environments commonly contain asbestos. However, Kleinfelder's assessment did not attempt to identify all possible gaskets at the facility. A metal-clad fire door with asbestos-containing insulation (50% asbestos) was found in the central portion of the large warehouse. The materials are considered in good condition. Disturbance of the materials, however, would render them friable. The asbestos-containing drywall/joint compound materials and the gaskets must be removed prior to renovation or demolition.

Asbestos-Containing Materials—City of Troutdale Property

Asbestos was detected floor tile (5%) and mastic (10%) located in the building located between the aeration basin and the clarifiers. The materials are considered in good condition and non-friable. Additionally, a sample of an exposed gasket on a flange of one of the aboveground storage tanks adjacent to the Parks and Facilities office contained 65% asbestos. The gasket is considered friable. The floor tile and mastic and the asbestos-containing gaskets at the WWTP site must be removed prior to the renovation or demolition.

¹ NESHAPS: National Emission Standards for Hazardous Air Pollutants

Lead-Containing Paint—Eastwind Development Property

Lead was detected in 8 out of 11 paint coating samples collected from the predominant interior and exterior paint coatings. The detectable concentrations ranged from 70 to 94,000 mg/kg² lead. The highest lead result was exterior paint that contained 94,000-mg/kg lead (white paint on block exterior wall). The next highest lead result was 2,700 mg/kg for the exterior green paint of the Eastwind warehouses. The lead-containing paints on the site buildings were considered to be in good condition and well adhered to the substrate.

Lead-Containing Paint—City of Troutdale Property

Lead was detected in 9 out of 24 paint coating samples collected from the predominant interior and exterior paint coatings. The detectable concentrations ranged from 70 to 500 mg/kg lead. The highest lead result was for a paint chip sample of exterior green paint that contained 500-mg/kg lead. The lead-containing paints on the site buildings were considered to be in good condition and well adhered to the substrate.

Lead-Containing Paint—General Discussion

Except for the 94,000-mg/kg lead result, the samples had detectable lead concentrations well below U.S. EPA's definition of lead-based paint (5,000 mg/kg). However, the U.S. Occupational Safety and Health Administration (OSHA) recognizes the painted surfaces as lead-containing; therefore, they must be handled accordingly. If these materials are left in their present state and undisturbed, they are not expected to present a health hazard. If renovation, remodeling, or demolition requires disturbing any of the lead-containing paint or if the lead-containing painted surfaces are to be removed, then the materials must be managed by a qualified licensed contractor. Additionally, the contractor must manage the lead-containing paint in accordance with OSHA, U.S. EPA, and any state or local regulations that are applicable to lead paint abatement projects.

Demolition of the site buildings with the lead-containing paint is generally permissible if:

- Basic engineering dust controls are employed during demolition,
- The contractor is notified and is using notified and properly trained personnel,
- A waste characterization sample is collected of the paint and substrate (core) and analyzed by TCLP lead analysis and shown to be less than the hazardous waste characteristic of 5 mg/l,³ and
- A Subtitle D permitted landfill with a composite liner and leachate collection system may exercise the DEQ Policy 97-PO-002A that allows acceptance of building debris with lead-containing paint without TCLP lead analysis.

² mg/kg: milligrams per kilogram

³ mg/l: milligrams per liter

The demolition contractor is responsible for determining the appropriate level of training and medical monitoring for their employees. The TCLP-lead results for a white paint and concrete composite sample was reported to be 5.79 mg/l, which is above the waste characteristic is greater than 5 mg/l. Generally speaking this would indicate future construction debris would be considered hazardous waste. See additional discussion and recommendation in next section.

Mercury-Containing Fixtures

There is a potential for up to 10 thermostats in the site buildings that may contain mercury switch. The following quantity estimates were compiled during the survey:

Eastwind Development Property

- Fluorescent light tubes: approximately 580
- Metal halide/high pressure sodium: approximately 5 lights and fixtures

City of Troutdale WWTP Property

- Fluorescent light tubes: approximately 100

The mercury switches and light tubes can be recycled and considered “universal waste” rather than hazardous waste.

PCB-Containing Fixtures

Kleinfelder noted the presence of light fixtures that have ballasts that could contain PCBs. Kleinfelder did not dismantle light fixtures; therefore, only a total count of fluorescent light fixtures is provided. Those light ballasts that are not labeled as “non-PCB” must be assumed to contain PCBs and must be disposed as Toxic Substance Control Act (TSCA) waste at an appropriate facility. The following quantity estimates were compiled during the survey:

Eastwind Development Property

- Fluorescent light fixture ballasts: approximately 220

City of Troutdale WWTP Property

- Fluorescent light fixture ballasts: approximately 50

3.0 RECOMMENDATIONS

It is our understanding that demolition of the site buildings is proposed. Therefore, our recommendations are focused to address removal of ACMs prior to demolition.

Asbestos-Containing Materials

Notification of the presence of ACMs to the employees and sub-contractors is required under Hazard Communication regulation (29 CFR 1926.59) and the Occupational Exposure to Asbestos Final Rule (29 CFR 1910.1001), as long as there are ACMs in the building. The burden of the notification is on the building owner and facility operator. In addition, the persons mentioned above must be notified of the presence and location of ACMs; the health risk related to asbestos; and work activities to avoid because asbestos is located in the work place. This can be provided by an Asbestos Awareness two-hour training class.

Prior to demolition of the site building, an asbestos abatement plan (Project Specification) must be developed by a certified asbestos project designer in accordance with federal regulations. Abatement of the ACMs must be conducted prior to disturbing these materials and be performed by a qualified licensed asbestos abatement contractor. Additionally, the abatement contractor must manage the ACMs in accordance with Oregon-OSHA, U.S. EPA, and the Oregon DEQ regulations. If un-sampled building materials are encountered during future construction activities, they must be considered to be ACMs until testing proves otherwise. Handling of un-sampled building materials must be conducted as if they were ACMs.

Drywall/joint compound wall systems with a trace amount of asbestos (<1%) are not considered asbestos-containing building materials by U.S. EPA or Oregon DEQ. Cutting the wallboard should be avoided. However, Oregon and Federal OSHA do not allow compositing results across building material layers, even for wallboard systems. Thus, wallboard sample results that have greater than 1% asbestos in any individual layer is regulated by OSHA, and these materials may require full abatement prior to renovation or demolition.

Lead-Containing Paint

Notification of the presence of lead-containing paint coatings to employees, sub-contractors, and building owners is required under Hazard Communication regulation (29 CFR 1926.59). Disturbance of lead-containing paint coatings should be avoided. Activities to avoid include: sanding, grinding, heat application, etc. Deteriorating/delaminating paint on the site building must be properly abated, packaged, and disposed as lead-containing paint waste. The OSHA Lead in Construction Standard (29 CFR 1926.62) is applicable, which includes information on when medical surveillance for employees is required. A licensed qualified contractor must manage the

lead-containing paint in accordance with OSHA, U.S. EPA, state, or local regulations that are applicable to lead paint abatement projects.

The waste characterization sample collected of the lead-containing paint and concrete substrate (large warehouse of the Eastwind Development property) was 5.79 mg/l, which is just above the 5-mg/l hazardous waste characteristic for lead. Even though the toxicity characteristic was exceeded, it is Kleinfelder's opinion that future building debris would be considered non-hazardous construction and demolition debris. Kleinfelder recommends that the contractor pre-arrange disposal of the construction and demolition waste with an appropriate landfill that is notified about the lead-containing paint.

Kleinfelder further recommends that engineering controls be implemented to control dust, and potentially, release of lead dust to the environment

Mercury-Containing Fixtures

Kleinfelder recommends removal of the mercury switches and light tubes within the site building for recycling as "universal waste" prior to building demolition.

PCB-Containing Fixtures

Kleinfelder recommends that the abatement contractor or demolition contractor dismantle each of the fluorescent light fixtures after they are de-energized to look for "non-PCB" labels. If there are any ballast labels that do not have "non-PCB" or "does not contain PCBs," then the ballasts must be packaged for transportation and disposal as TSCA waste at an appropriate facility. The ballast should be removed from the light fixture to reduce the quantity of material for disposal.

4.0 ASBESTOS SURVEY METHODOLOGY

Kleinfelder conducted this asbestos survey in accordance with the authorized scope of work. The survey was conducted by an U.S. EPA accredited Building Inspector and Management Planner for asbestos.

4.1 Building Walk-through & Sampling Plan Preparation

Kleinfelder conducted a building walk-through to document existing conditions and identify homogeneous materials and areas. Homogenous materials were transcribed onto forms for documentation and to assist in the preparation of a sampling plan. Suspect materials were grouped into homogeneous areas and then sampled accordingly. Sampling procedures were performed in general accordance with U.S. EPA protocols. The quantities of bulk samples collected generally followed the U.S. EPA protocols of three, five, or seven samples of homogeneous surfacing materials; three samples of thermal system insulation (TSI); and a “sufficient” number of bulk samples from miscellaneous materials. Kleinfelder departed from the quantity protocols if, based on the judgment of the inspector:

- The building materials did not usually contain asbestos (e.g., metal, fasteners, wood, concrete, furniture, electrical equipment, fiberglass, rubber, glass, terrazzo, ceramic tile, and architectural brick);
- Electrical wire insulation for wire that has not been locked out/tagged out by a licensed electrician;
- The building material would be damaged in order to collect the sample (e.g., fire doors, mudded joints above plaster ceilings, ceramic tile, etc.); or
- The building materials were shown to contain asbestos in nearby areas.

4.2 Assessment of Building Material Hazard Characteristics

Kleinfelder evaluated the friability and physical condition of the building materials suspected to contain asbestos. According to the U.S. EPA, a friable material can be reduced to dust or powder with slight pressure, such as hand pressure. A non-friable material contains asbestos fibers that have been “locked-in” by a bonding agent, coating, or other material, so that fibers are not released during appropriate use or handling.

ACMs in good condition are those that have no visible damage or deterioration. ACMs in good condition do not present a health hazard if maintained in such a condition and left undisturbed. An ACM in fair condition exhibits minor damage (<10% area or <25% localized) and has the potential to release asbestos fibers if disturbed. An ACM in poor

condition has significant damage (>10% area or >25% localized) and has the potential to release asbestos fibers during normal use or operations.

4.3 Sample Collection & Analysis

Kleinfelder collected bulk samples of building materials suspected of containing asbestos. The building material was sprayed with a surfactant, collected using the appropriate tool, placed into a sealed freezer bag, and labeled with a sample number. A temporary patch was applied to the sampled building material. Kleinfelder double-bagged and shipped the samples under chain-of-custody procedures to the analytical laboratory.

Forensic Analytical of Hayward, California, a National Voluntary Laboratory Accreditation Program (NVLAP) laboratory, analyzed the samples by polarized light microscopy (PLM). PLM analysis identifies asbestos to a detection limit of 1%. If asbestos is present, it is then classified as to its type: amosite, chrysotile, tremolite, etc. Copies of the chain-of-custody forms and analytical reports are attached.

5.0 LEAD-CONTAINING PAINT COATING SURVEY METHODOLOGY

5.1 Regulatory Background for Lead-Containing Paint Coatings

EPA and HUD regulate *lead-based* paint if it is at or greater than 0.5% by weight or 5,000 parts per million (ppm). OSHA regulates lead-containing paint with respect to employee exposure.

All work with a material containing lead above the analytical laboratory's reporting limit (detection limit), must be treated as having a potential to exceed OSHA's Permissible Exposure Limit (PEL) for total lead (50 micrograms per cubic meter of air). The employer must implement special work practices unless it can be shown by one of the following methods to produce air concentrations of lead below the PEL:

- Previous experience with similar activities, lead concentrations, and workers.
- Calculations of estimated air concentrations based on planned activities, lead concentration in paint, thickness of paint, and surface area to be disturbed.
- Personal exposure monitoring.

Therefore, any demolition work that will disturb lead-containing paint (material containing any reportable quantity of lead) will be subject to the Lead Construction Standard and should only be handled by a licensed and qualified contractor. The contractor must provide the following for the employees (not an all-inclusive list):

- Medical surveillance with blood lead testing
- Respirator training and fit-testing
- Training on health hazards of lead
- Change work area

On the basis of historical projects, building materials that have lead-containing coatings can be demolished with the buildings and disposed as non-hazardous construction debris. Kleinfelder's experience is that the TCLP value for lead-containing coatings will be below the 5 mg/l threshold for lead if a core sample of the paint coating and the substrate (e.g., plaster, concrete, drywall) is collected.

5.2 Sample Collection & Analysis

Selected painted surfaces were tested for the presence of lead by collecting chip samples from paint considered to be the predominant paint coating in each building. The paint chip sample is an approximately 1x1-foot area, which represents potential paint layers. As with asbestos sampling procedures, a chain-of-custody is also used to document transfer of the samples.

Upon receiving the total lead analytical results, Kleinfelder collected a “core” sample of the worst-case paint coating and underlying building material for TCLP lead analysis. The purpose of the sampling is to characterize what would be future building debris for disposal purposes. Forensic Analytical of Hayward, California, analyzed the samples by U.S. EPA Method 3050B/7420. The analysis quantifies lead to a detection limit of approximately 60 mg/kg or 0.006% by weight. The detection limit is determined by the amount of material in each individual sample. Specialty Analytical of Tualatin, Oregon, analyzed the lead waste characterization sample by TCLP. Copies of the chain-of-custody forms and analytical reports are attached.

6.0 BUILDING DESCRIPTION

Eastwind Development, 302 NW 257th Way

Small Steel Warehouse: There is a rectangular steel warehouse in the western portion of the 302 NW 257th Way property. The warehouse was constructed on a concrete slab. The warehouse has overhead doors. There is a small office in the building.

Large Abandoned Warehouse: There was a large warehouse located on the 302 NW 257th Way property. The building appeared to have been constructed in stages because there was steel-sided, brick, and concrete wall construction evident. Kleinfelder noted timber framing, wood siding, and concrete floors. Portions of the building were more than two stories tall. The building had a boiler room on the western end of the building. Adjacent to the boiler room was a single-story office building.

The building had loading docks on the northern side of the building. A large, covered truck port was also located on the northern side of the building. Concrete slabs were present outside the building's western door, under the truck port, and at the loading dock. A loading platform was located on the southern side of the building.

Water Tower and Cellular Antenna: A large, steel water tower was located north of the large warehouse. It was not known whether the tower contained water. There were cellular antennas on the water tower. A small, fenced compound was located at the base of the tower for the antenna control room and backup generator. There was no access to this compound or the water tower.

Clarifiers: There were two concrete clarifiers to the west and north of the large warehouse. The clarifier on the west appeared to be older and the equipment normally seen on clarifiers was no longer present. The clarifier to the north of the warehouse appeared to be associated with subsurface vaults and chlorine contact equipment in adjacent sheds.

City of Troutdale, 410 and 320 NW 257th Way

Metal warehouse/shop: This building has metal siding and steel structure. The floor is a concrete slab.

Digester Building: The building was centrally located and was formerly part of the wastewater treatment process at the facility. The digester was not operational. The building has a below grade level where some of the equipment is located.

Primary and Secondary Clarifiers: There are three clarifiers, which were circular pits partially filled with storm water. The clarifiers were not operational at the time of the site visit.

Aeration Basin: The aeration basin is an oval-shaped concrete-lined basin that was formerly used for secondary treatment of wastewater.

Chlorine Contact Basin: This basin was located on the eastern side of the Wastewater Treatment Plant (WWTP). It was originally used to disinfect treated water prior to discharge to the Sandy River. The WWTP retrofitted the basin with UV lamp treatment system.

Laboratory Building: This small, square-shaped building on the eastern side of the treatment plant was formerly used by WWTP staff to analyze wastewater samples. The building had a concrete slab.

Parks & Facilities Office/Shop (320 NW 257th Way): This building is currently occupied by the City of Troutdale Parks & Facilities and is used as an office and shop. The building had a concrete slab.

7.0 ASBESTOS SURVEY RESULTS

Kleinfelder (Mr. Cris Watkins) conducted an asbestos survey of the building on March 15, 16, and 17, 2006. The analytical results and material descriptions are presented in Tables 1 and 2.

Table 1 Eastwind Development Warehouses (see Figure 1)

8.0 LEAD-CONTAINING PAINT COATING SURVEY RESULTS

Kleinfelder (Mr. Cris Watkins) conducted a Lead-containing Paint Survey of the building on March 15, 16, and 17, 2006, by collecting paint chips of predominant interior and exterior paint coatings. The limit of detection varied from sample to sample.

Table 3, Summary of Paint Chip Analytical Results—Eastwind Development

MTL #	MATERIAL DESCRIPTION	LOCATION	RESULT MG/KG
63608-EW-P1-1	Ext. red paint	Main warehouse North wall	2,500
63608-EW-P2-2	Int. White paint	Main warehouse North wall	70
63608-EW-P3-3	Int. Brown paint	Central corridor	730
63608-EW-P4-4	Int. White paint	Central corridor	700
63608-EW-P5-5	Int. Red paint	Central corridor	120
63608-EW-P6-6*	Ext. white paint See discussion below this table	West side of main warehouse	94,000
63608-EW-P7-7	Int. White paint	Drywall areas in offices	ND
63608-EW-P8-8	Int. white paint	Concrete interior walls	ND
63608-EWP9-9A	Ext. green paint	Woodshop and main warehouse	ND
63608-EWP9-9B	Ext. green paint	Woodshop and main warehouse	2,500
63608-EWP9-9C	Ext. green paint	Woodshop and main warehouse	2,700

*Sample number 63608-EW-P6-6 was considered the “worst case” total lead result. Kleinfelder returned to the site to collect a core sample near the same location. The purpose of the core sample was to collect a sample of paint and the underlying substrate for hazardous waste characterization. The analytical laboratory reported 5.79 mg/l leachable lead.

9.0 LIMITATIONS

Kleinfelder has performed this work in accordance with generally accepted standards of care practiced by other members of our profession in Oregon at the time the work was completed. The completed survey was limited to the areas sampled in the buildings at the subject site described in this report. Our findings are limited to visible and accessible building materials and the results reported for the time the surveys were completed. More extensive studies including additional building material sampling may be used to supplement the information presented by this assessment. Kleinfelder should be notified for additional consultation if the client wishes to reduce uncertainties beyond the level associated with this assessment. Our assessment of the asbestos and lead-containing paint issues may also change as new data becomes available during additional site investigation.

The services presented in this report were not intended to identify all potential concerns or eliminate all risk associated with the subject property. Even the most rigorous of professional studies may fail to identify all conditions or contaminants.

This report may be used only by City of Troutdale and Eastwind Development, LLC, and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Unauthorized use or copying of this document is strictly prohibited. Kleinfelder authorizes the use of this document by the client and bidding contractors. Land or facility use, on and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Any party other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and client agrees to defend, indemnify, and hold harmless Kleinfelder from any claim or liability associated with such unauthorized use or non-compliance.

No warranty, expressed or implied, is made.

1.0 INTRODUCTION

This report documents the methodology and findings of a Phase I Environmental Site Assessment (Phase I ESA) for an approximately 19.6-acre site in Troutdale, Oregon (Figure 1). The City of Troutdale retained Kleinfelder to perform the work in general accordance with the American Society of Testing and Materials (ASTM) Standard E 1527-00, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* and Kleinfelder's October 27, 2005, proposal (6050PROP/POR5P186).

The site consists of four parcels, two owned by the City of Troutdale and two owned by Eastwind Development LLC. In the course of Kleinfelder's research into the site, Kleinfelder noted two addresses associated with each parcel, though the numbering remained the same. Both NE Harlow Road and NW 257th Way have been used for the site addresses. It appears that the NE Harlow Road addresses predated the NW 257th Way address. For the purposes of this Phase I ESA, Kleinfelder uses the NW 257th Way street name in describing the site parcels, unless historical resources dictate the use of the NE Harlow Road street name.

The Phase I ESA included a review of available regulatory agency databases and records, aerial photographs, and a site visit. The findings and conclusions are presented in detail in Section 2.0 with recommendations in Section 3.0. The basis for the conclusions are the result of Kleinfelder's research, which follows in Sections 5.0 - 10.0.

2.0 FINDINGS AND CONCLUSIONS

The following conclusions are based on Kleinfelder's knowledge of the subject property from our site observations and information gathered during our review. These conclusions are subject to the limitations presented in Section 4.3, and may change if additional information becomes available.

1. **EASTWIND DEVELOPMENT SITE HISTORY (302 NE HARLOW ROAD):**

Historical data and interviews indicated that the 302 NE Harlow Road property had been developed as early as 1901. The earliest available historical data indicated two large warehouses had been located on the property and occupied by Union Meat Company Abattoir (slaughterhouse). The slaughterhouse had corrals and pasture areas to the north of the buildings. The buildings were used for processing livestock, including a rendering and glue plant. Rail access was present as early as 1901. The 1901 and 1909 Sanborn Maps indicated that two "oil house" buildings had been present east of the current warehouse, presumably to store oil containers for on-site machinery.

The 302 NE Harlow Road facility had changed many times between its original construction prior 1901 and the shut down of the wool pullery around 1970; however, the business use of the property during that time appears to have remained consistent as a slaughterhouse, hide processor, and/or wood pullery. Many construction projects over the subsequent years resulted in the expansion of the facility. A significant change in the building configuration had apparently occurred around 1922, when the main slaughterhouse may have been demolished and rebuilt. The rendering plant, the other building at the site, apparently had been removed by 1925. Bissinger & Company was the slaughterhouse (also referred to as a wool pullery) operator between 1925 and 1931. However, the slaughterhouse remained the primary use of the property until the operation ended on an unknown date. Because there was a settling pond north of the large warehouse in 1968, Kleinfelder speculates the slaughterhouse may have been in operation as late as 1968. The main warehouse shown on the 1925 Sanborn Map is essentially the same warehouse building currently on-site. A smaller steel warehouse had been constructed at the property prior to 1968. This smaller warehouse is currently located on-site and occupied by a woodworking business. Mr. Doug Jones, a person with personal knowledge of the Eastwind Development site since 1997, indicated that the wool pullery building was vacant for a number of years until around 1972 when Don Bennett purchased it. The Bennetts (Don and David) operated a cabinet making/woodworking business in the large warehouse until around 1999. Mr. Junki Yoshida obtained a partial interest in the site around 1999/2000 and obtained full ownership of the building around 2003, according to Mr. Jones. Mr. Jones has been a tenant on-site (woodworking) since around 1997.

Recently, the Gresham Fire and Emergency Services condemned the large warehouse building because of unsafe conditions. Therefore, Kleinfelder only had limited visual access to portions of the eastern half of the warehouse. Gus Lian of the City of Gresham reported that their inspection did not reveal environmental concerns regarding chemical storage. Kleinfelder believes it would be prudent to inspect the building in the future.

Kleinfelder believes that there is a potential that former slaughterhouse activities (tanning) may have resulted in the presence of chromium and volatile organic compounds (VOCs) in site soils and in sediment in the bottom of on-site clarifiers. A settling pond is shown in the 1968 aerial photograph that could have been used for wastewater discharged after primary treatment in on-site clarifiers. It is not known whether there is an environmental concern at this time. The passage of time (nearly 30 years) since the plant was in operation may have lead to the attenuation of potential contaminants.

D and D Manufacturing/Third Dimension (owned by Don and David Bennett) appears to have been a business entity that had operated at the 302 NW 257th Way property from the early 1970s to the late 1990s. The business was considered a "Small Quantity Generator" of hazardous waste under RCRA.¹ There were violations reported by the U.S. Environmental Protection Agency (U.S. EPA) for citations that had occurred in the 1991 to 1992 timeframe. The details of the violations are not known, but they are likely due to waste storage practices and/or administrative issues. Kleinfelder discusses below, under the issue "Chemical Containers," that several chemical containers from plastic tubes of adhesive to 55-gallon drums with unidentified liquids were observed at the Eastwind Development site. The presence of the chemical containers is considered an environmental concern. Additionally, the cabinet making businesses likely used adhesives and resins, but Kleinfelder did not observe indications of on-site disposal of such items. Other than the listing for D and D Manufacturing as a RCRA Small Quantity Generator, this property was not listed on the various federal and state environmental cleanup databases researched for this project.

- 2. CITY OF TROUTDALE SITE HISTORY (320/410 NE HARLOW ROAD):** Historical data and interviews indicated that the City of Troutdale Wastewater Treatment Plant (WWTP) property consists of two tax lots. The property was developed, at least in the southwestern corner, as a boarding building for employees of the Union Meat Company's slaughterhouse in 1901 and 1909. In 1925, the 320/410 NE Harlow Road site consisted of mostly agricultural fields. A farmhouse and outbuildings were located in the northeastern corner of the site. In 1969, construction of the WWTP began after the City of Troutdale obtained ownership of the property. The WWTP underwent expansions in 1979 and 1992. One of the WWTP features was the former presence of un-lined sludge storage ponds (approximately 100,000-gallon

¹ Resource Conservation and Recovery Act

capacity) and the current presence of a 1-million gallon lined lagoon that formerly received sludge. Kleinfelder believes there is a potential that the soil beneath the old ponds could have accumulated concentrations of metals and semi-volatile organic compounds. Kleinfelder believes there is a potential environmental concern regarding the soil beneath the former sludge storage ponds.

A portion of the WWTP was leased to a private company, Purifax, that operated between the mid 1980s and 1996. The purpose of the business was to accept septic waste, treat the waste, and discharge the effluent to the WWTP. The WWTP eventually ended the lease due to ongoing problems with the effluent concentrations being discharged to the WWTP.

The WWTP was shut down in 2001 in favor of a new WWTP to the north of the site. The City of Troutdale still controls and operates the subject site. Mr. Mike Sorensen, City of Troutdale Public Works Department, stated that since the WWTP was closed in 2001, the wastewater treatment equipment (headworks, aeration basin, UV contact basin, and clarifiers) had been pumped to the new WWTP several times because of the accumulation of rainwater. These activities would likely reduce the potential for pathogens² still being present in these features. If pathogens are present in residual sludge, sediments, and on structural/plumbing components during future demolition, there could be a health hazard to construction workers.

The Parks and Facilities Department currently use some buildings at the WWTP. According to Mr. Jim Galloway and Mr. Sorensen, City of Troutdale Public Works Department, there were no known releases of hazardous substances to the site soil or groundwater at the subject site. There were no known underground storage tanks (USTs). Kleinfelder's research did not reveal recognized environmental conditions associated with the WWTP past or current operations.

- 3. UNDERGROUND STORAGE TANK (UST):** There appears to be a fuel oil UST outside the large warehouse on the 302 NE Harlow Road site. The UST appears to be connected by underground piping to the building's boiler room. There is no available information about the status of the UST. If the UST was primarily used in industrial processes as opposed to heating, then it may be regulated by Oregon Department of Environmental Quality (DEQ). If the UST had leaked, then the UST is regulated by DEQ. The site was not listed on the DEQ database of registered or leaking USTs. There is no documented recognized environmental condition at this time; however, the lack of information does not preclude the possibility of a release in the past. Additional assessment of the UST and surrounding soil is necessary to evaluate whether there is a recognized environmental condition and an environmental liability beyond the cost to remove the UST.

² An agent that causes disease, especially a living microorganism such as a bacterium, virus, or fungus.

4. **ON-SITE RAIL SPUR:** The larger of the Eastwind Development parcels includes an old rail spur that runs parallel to a loading platform connected to the large warehouse. Additionally, there appears to be a portion of an equipment storage yard associated with Union Pacific Railroad vehicles that is also located on the Eastwind Development site. Kleinfelder had limited access to the on-site rail spur due to the overgrown blackberries below the platform. At least part of the rail spur appeared to have a concrete “floor.” On the basis of the site history, it is likely that boxcars parked on-site were used to transport livestock and the end products of the slaughterhouse, rather than chemical transport. At this time, there does not appear to be a recognized environmental condition associated with the presence of the rail spur.

5. **ON-SITE SOLID WASTE DISPOSAL:** There were multiple piles of debris located northeast of the 302 NE Harlow Road warehouse. The piles have not been fully evaluated as to whether there are chemical containers present under the wood and household junk debris. At this time, there is no documented recognized environmental condition associated with this issue.

There was a riverbank stabilization project involving the City of Troutdale and the U.S. Army Corps of Engineers (USACE) in 1993. The 1993 project involved revetment (rock lining) of the Sandy River bank adjacent to the WWTP. During the excavation work, the construction contractor encountered buried waste on the bank. The USACE determined that the waste material was not a potential hazardous material issue. USACE documented that the landfilled debris was 90-95% particleboard. Much of the material had a veneer finish, and other disposed materials included concrete, a tire, rubber gaskets, plastic containers, etc. It is likely that the entire “landfill” had not been excavated during the project. At this time, there is no documented recognized environmental condition associated with this issue. However, the remaining buried debris could be an issue to future redevelopment from a constructability perspective and in the event chemical containers were part of the landfill that was not previously excavated.

The historical land use of the Eastwind Development site involved the handling of wastewater at a former slaughterhouse. Wastewater may have been treated on-site through the use of clarifiers, chlorine disinfection, and a sludge settling pond. There is a potential that a settling pond or waste sludge pond, formerly located on the Eastwind Development site, could have received animal waste. Therefore, Kleinfelder believes there is a potential for chromium accumulation in the subsurface soil below the former settling pond, and there is a potential that subsurface soil could be impacted by pathogens that could be a health risk to future construction workers. It is likely that a complete decommissioning of the clarifiers and plumbing (flush and disinfection) and former settling pond (sludge removal) on the Eastwind Development site has not occurred. Kleinfelder believes there is a potential health hazard to construction workers if pathogens from former animal processing are

present in trenches, pipes, and clarifiers at the site. Further assessment of this issue would be prudent to protect worker health and safety.

It is Kleinfelder's opinion that there is a potential for buried waste on-site that may include parcels owned by both the City of Troutdale and Eastwind Development. Our opinion is based on the more than 105-year industrial use of the subject site that involved the development and demolition of multiple buildings (primarily on the Eastwind Development site); the construction and filling of a settling pond around 1968 (Eastwind Development site); the construction and removal of a possible levee system (on both properties); and the current presence of debris piles as mentioned above. Buried "waste" could include additional particleboard, wood debris, animal waste, fill dirt, and construction and demolition debris. If there are significant areas of fill, there may be potential future development issues that would need to be addressed during site development. If chemical containers were buried or hazardous substances were spilled, then there would likely be special handling and disposal issues to consider.

The closure of the WWTP in 2001 likely included the removal of remnant sludge and partially decommissioning of wastewater treatment basins and tanks. However, Mr. Sorensen has indicated that there is still sludge in the digester building and lagoon that the City of Troutdale is periodically pumping into trucks for removal. Mr. Sorensen is hoping the sludge will be completely removed by the Summer of 2006. When the site is redeveloped in the future, if all the waste sludge is removed and the WWTP equipment is cleaned and flushed, then the potential for a health hazard associated with pathogen contamination and future construction activities and redevelopment would be reduced.

6. **ON-SITE WELL(S):** A well was noted on the Eastwind Development site in a pump house. No well log was discovered for the well. There were two well logs recorded for the Eastwind Development site. The well logs indicated that two monitoring wells (presumably temporary) were advanced to 12.5 feet adjacent to the water tower, which is north of the large warehouse. The wells were drilled in October 1994 by Paul Stroup. The holes were reportedly sampled then filled with bentonite. Kleinfelder was not provided analytical data for samples collected from these two wells/borings. Mr. Mike Sorenson indicated that the WWTP site had two dewatering wells that were installed in 1969 and 1979 that were used to protect the clarifiers. The presence of a well, in and of itself, does not represent a recognized environmental condition. However, an uncapped or un-abandoned well can serve as a conduit for contaminants to groundwater. If the wells will not be used, the Oregon State Water Resources Department requires that the wells be capped and locked or properly abandoned.
7. **CHEMICAL CONTAINERS:** Various chemicals were stored at the WWTP property. The pesticides/herbicides are primarily used off-site. Some chemicals are used on-site, such as cleaning chemicals and small engine service petroleum products. In

general, the housekeeping of chemicals and containers at the WWTP appeared satisfactory. Kleinfelder did not observe issues with storage that indicated an immediate risk of release because of poor handling. Kleinfelder does not consider the presence or storage of these products to represent a recognized environmental condition.

Chemical containers (paint, adhesive, thinners) were noted in the Lavivrus Woodworking warehouse at 302 NW 257th Way property (Eastwind Development). The storage of the chemicals appeared satisfactory, and Kleinfelder does not consider the presence of the Lavivrus chemicals to be a recognized environmental condition.

Kleinfelder noted chemical containers at or immediately around the large warehouse located at 302 NW 257th Way / NE Harlow Road. 55-gallon drums with unidentified contents were stored outside the building that may contain mostly rainwater; however, it is not known whether there is a mixture of rainwater and chemicals in some of the drums. Kleinfelder observed 12 to 15 plastic tubes of adhesive in an old box trailer parked at the loading dock. The tubes did not appear to be leaking. A compressed gas cylinder that may contain chlorine was present in a shed north of the large warehouse. Numerous small (up to 5 gallons) chemical containers were observed inside the large warehouse. The contents of the containers were not noted, as they were located in the area that had been condemned. Kleinfelder also observed three small hydraulic oil reservoirs and 5-gallon containers in a shed connected to the north side of the large warehouse.

8. **TRANSFORMERS:** Pole-mounted and pad-mounted transformers were located at the WWTP and the Eastwind Development properties. No staining or leakage was noted. The responsibility for handling and disposal of transformers is the owner's (electric utility) should they be taken out of service. Because no leakage was noted, Kleinfelder does not consider the transformers to be a recognized environmental condition.
9. **SEPTIC SYSTEM(s):** A septic system was likely once connected to the farmhouse located in the northeastern corner of the WWTP property. Mr. Mike Sorensen of the City of Troutdale believed that the house was demolished by the City of Troutdale in the late 1980s or early 1990s. He did not know for sure whether the septic system was decommissioned at the same time. There is a potential that a septic system is still present but is not an issue that requires further investigation unless a tank is encountered during future site development. On the basis of current information, there does not appear to be a recognized environmental condition associated with the septic system should it exist.

The former slaughterhouse operation was present on the Eastwind Development as early as 1901. There was no municipal sanitary sewer connection until long after 1969. A clarifier may not have been installed at the facility until the 1920s. The

facility either had on-site septic systems or discharged all waste directly to the river. After the clarifiers were installed, it is possible that all wastewater could have been processed at the facility prior to discharge. There is a potential that a septic system is still present but is not an issue that requires further investigation unless a tank is encountered during future site development.

10. FLUORESCENT LIGHT FIXTURES (PCBs & MERCURY): There is a possibility that polychlorinated biphenyl (PCB) containing light ballasts may be present where older fluorescent light fixtures are present on-site. Non-PCB containing ballasts should be labeled as such. Unlabeled ballasts should be assumed to contain PCBs. Unless the ballasts are labeled as “non-PCB” containing, they will require special handling and disposal as TSCA³ waste prior to site demolition. Kleinfelder does not consider this issue to represent a recognized environmental condition. Fluorescent light tubes can contain mercury vapor. It is commonly considered that light tubes with silver ends contain mercury. In general, mercury-containing light tubes should be properly disposed or recycled prior to demolition of the site buildings.

11. ASBESTOS-CONTAINING MATERIALS & LEAD-CONTAINING PAINT: During the site reconnaissance, Kleinfelder noted building materials that have the potential of containing asbestos, such as: floor coverings, drywall/joint compound, ceiling tiles, roofing materials. An asbestos survey has reportedly not been conducted for the site buildings. According to U.S. EPA regulations, building materials must be assumed to contain asbestos, and managed as such, unless they are sampled and proven otherwise (40 CFR 763). U.S. EPA, Oregon Department of Environmental Quality (DEQ), and Oregon OSHA regulations require that an asbestos survey be conducted of the site buildings prior to demolition or renovation.

There is also a potential for the presence of lead-containing paint coatings, based on the age of the buildings. In the event the houses are demolished, the demolition contractor must be notified of the presence of lead-containing paints (should it be present) so that the contractor may use properly trained employees. Additionally, the disposal of building debris will be based on whether the building materials with lead-containing paint are considered hazardous or not.

12. OFF-SITE LEAKING UST FACILITY INVESTIGATIONS: Fifteen leaking UST facilities were located within 0.5 miles of the subject site. There were no off-site releases documented to have contaminated the site groundwater, and therefore, there is no documented recognized environmental condition related to the off-site facilities.

13. OFF-SITE FACILITY INVESTIGATIONS: One state hazardous waste investigation was located within 0.5 miles of the subject site. The facility was located

³ TSCA: Toxic Substances Control Act

downgradient of the subject site. Kleinfelder does not consider this facility to represent a recognized environmental condition.

3.0 RECOMMENDATIONS

Kleinfelder's Phase I Environmental Site Assessment revealed environmental concerns resulting from current or historical on-site activities. The following recommendations are presented to assess the significance of the risk associated with these environmental conditions.

1. **LARGE WAREHOUSE (EASTWIND DEVELOPMENT SITE):** Kleinfelder recommends that a site visit of the large warehouse that was condemned by the City of Gresham Fire and Emergency Services be conducted. As mentioned above, Kleinfelder was not provided access to this structure. Kleinfelder considers the lack of access to be a data gap in this Phase I ESA, but one that can be performed at a later date upon clearance by the City of Gresham Fire and Emergency Services.
2. **FORMER TANNING AND SLAUGHTERHOUSE OPERATION (EASTWIND DEVELOPMENT SITE):** Kleinfelder recommends that the subsurface soil around the former settling pond, the former glue factory, and around the eastern side of the large warehouse (302 NW 257th Way) be assessed for the potential presence of metals (primarily chromium), VOCs, and semi-volatile organic compounds. The purpose of the assessment is to evaluate whether there are potential impacted areas based on concentrations of metals (primarily chromium) and VOCs in excess of the U.S. EPA Region 10 Preliminary Remediation Goals (PRGs). These PRGs are risk-based cleanup goals for various organic and inorganic compounds.
3. **WASTEWATER TREATMENT PLANT:** If the WWTP property will be redeveloped in the future, Kleinfelder recommends that the City of Troutdale confirm whether the wastewater treatment system (clarifiers, digester, headworks, contact basin, etc.) had been sufficiently flushed and disinfected so as to reduce potential health hazards related to pathogens that could be present in sludge or sediments. Additionally, the City of Troutdale may consider conducting an assessment of the subsurface soil beneath the former sludge holding ponds that were filled for metals and semi-volatile organic compounds.
4. **FUEL OIL UST:** Kleinfelder recommends that the UST system noted next to the 302 NE Harlow Road warehouse be decommissioned by removal. Proper decommissioning will include the collection and analysis of soil samples to assess whether the UST had leaked and contaminated subsurface soil and/or groundwater.
5. **ON-SITE SOLID WASTE DISPOSAL:** Kleinfelder recommends that when the debris piles are removed from the Eastwind Development site that caution be exercised in case chemical containers or stained soils are encountered. Should containers be encountered they should be separated from the debris and properly disposed or recycled. Stained soils, if present, may need further assessment before excavation occurs.

In regard to the particleboard debris encountered by USACE's contractor in 1993, Kleinfelder recommends that a geotechnical engineer be informed of this information prior to future geotechnical studies related to redevelopment. Caution should be exercised during site development when grubbing or excavating in this area occurs in the event chemical containers or stained soils are present.

Kleinfelder also recommends that a ground penetrating radar (GPR) survey be performed in the former particleboard disposal area along with the former settling pond and former glue factory building footprint to look for buried (metallic) chemical containers such as drums and tanks. A GPR survey is limited by various factors such as depth of buried objects, interferences by buildings and parked vehicles, and subsurface soil types. However, a survey is a relatively inexpensive screening tool to help reduce the risk associated with buried objects that could result in an environmental liability to the property owner.

Kleinfelder recommends that the sediments in building trenches, clarifiers, and the subsurface soil in the former settling pond be assessed for pathogens, metals, and VOCs. If elevated concentrations are present, then Kleinfelder may recommend (1) that the clarifiers be pumped and disinfected; (2) the sediments be vactored and properly disposed; and (3) subsurface soils be excavated and properly disposed.

6. **FORMER "OIL HOUSE" BUILDINGS (EASTWIND DEVELOPMENT SITE):** Kleinfelder recommends that a GPR survey, recommended above, include the former locations of these two oil houses (shown on the 1901 and 1909 Sanborn Maps). It should be noted that the location of the two former oil house buildings is heavily overgrown with vegetation. Some clearing by heavy equipment would be necessary to access the area for a GPR survey.
7. **CHEMICAL CONTAINERS:** Kleinfelder recommends that all chemical containers on the Eastwind Development site, including hydraulic oil reservoirs, be collected, properly packaged, and recycled or disposed. The chemical containers at the Lavivrus Woodworking warehouse were still in use and are not included in this recommendation. Prior to demolition of structures at the WWTP or the Eastwind Development site, all chemical containers should be properly recycled or disposed.
8. **ON-SITE WELLS:** If site groundwater will be used in the future, the groundwater should be sampled and analyzed in accordance with its intended use. If the three wells that were revealed during this assessment (two dewatering wells at the WWTP and one industrial well on the Eastwind Development site) will not be used, they should be capped and locked (preserved for future use) or abandoned in accordance with state regulations.
9. **SEPTIC SYSTEM:** If a septic system is encountered during site development, it should be abandoned in accordance with City of Portland requirements.

10. **PCB-CONTAINING LIGHT BALLASTS:** If present, PCB-containing ballasts must be properly handled and disposed prior to demolition of the site buildings or if the fixtures are replaced.
11. **MERCURY-CONTAINING LIGHT TUBES:** Fluorescent light tubes with silver ends are generally considered to contain mercury vapor; therefore, the preferable disposal option for these light tubes is recycling as universal waste prior to demolition of the site building.
12. **ASBESTOS-CONTAINING MATERIALS & LEAD-CONTAINING PAINT COATINGS:** Kleinfelder recommends that an asbestos survey be performed prior to demolition of the site buildings. If asbestos-containing building materials are present in the buildings, then an abatement plan must be designed and the materials removed by a qualified asbestos abatement contractor.

Prior to demolition, paint samples should be collected and analyzed for the presence of lead. The purpose of the sampling is twofold: first, the results will indicate whether notification to the demolition contractor is necessary; second, if lead is present in the paint and the site buildings will be renovated or demolished, the results will help indicate whether abatement is necessary and whether or not the demolished building debris will be considered hazardous waste.

4.0 PURPOSE, LIMITATIONS, & SCOPE OF WORK

The following report summarizes work performed following the guidelines set forth in the ASTM *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E 1527-00), 2000.

4.1 Purpose

The purpose of the work described in this report was to identify, to the extent feasible, *recognized environmental conditions* existing at the subject property in general accordance with ASTM E 1527-00. A *recognized environmental condition* is defined as, “the presence, or likely presence, of hazardous substances or petroleum products on the property under conditions that indicate an existing release, a past release, or a material threat of a release of hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes *hazardous substances* or *petroleum products* even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not *recognized environmental conditions*.”

4.2 Special Terms and Conditions

This report may be used only by City of Troutdale and Eastwind Development LLC, and only for the purposes stated within a reasonable time from its issuance, but in no event later than 180 days from the date of the report. Land or facility use, on and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Any party other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and client agrees to defend, indemnify, and hold harmless Kleinfelder from any claim or liability associated with such unauthorized use or non-compliance.

4.3 Limitations and Exceptions of Assessment

Phase I ESAs are non-comprehensive by nature and are unlikely to identify all environmental problems or eliminate all risk. The attached report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of our clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help to better understand and manage site risks. Since such detailed services involve greater expense, we ask our clients to participate in identifying the level

of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss the issue of risk further.

The scope of work on this project was presented in our October 27, 2005, proposal and subsequently approved by you as our client. Please be aware our scope of work was limited to those items specifically identified in the proposal. Environmental issues not specifically addressed in the proposal or this report were beyond the scope of our work and were not included in our evaluation.

Kleinfelder performed this environmental assessment in general accordance with the guidelines set forth in the *ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (E 1527-00)*. The EDR Radius report, attached, is compliant with ASTM E 1527-05, which was approved at the end of November 2005 and the All Appropriate Inquiry (AAI) regulation that is effective November 1, 2006. If the client desires to upgrade this report to the E 1527-05 standard and AAI regulation to potentially qualify for one of requirements of the *innocent landowner defense* under CERCLA, then additional investigation may be required.

Land use, site conditions (both on-site and off-site) and other factors will change over time. Since site activities and regulations beyond our control could change at any time after the completion of this report, our observations, findings, and opinions can be considered valid only as of the date of the site visit. This report should not be relied upon after 180 days from the date of its issuance (ASTM Standard E 1527-00, Section 4.6).

The property owner is solely responsible for notifying all governmental agencies, and the public at large, of the existence, release, treatment or disposal of any hazardous materials observed at the project site. Kleinfelder assumes no responsibility or liability whatsoever for any claim, loss of property value, damage, or injury that results from pre-existing hazardous materials being encountered or present on the project site, or from the discovery of such hazardous materials.

No warranty, expressed or implied, is made.

4.4 Limiting Conditions and Methodology Used

The Phase I ESA generally follows the methodology set forth in ASTM Standard E 1527-00. The scope of work implemented for the Phase I ESA included the following:

- Review of federal, state, and local regulatory agency lists and databases of facilities that use, store, and/or generate hazardous chemicals, which would help reveal recognized environmental conditions;
- Site visit to assess visually obvious features or materials that may present the potential for recognized environmental conditions;

- General visual survey for readily visible suspect asbestos-containing materials (ACMs);
- Interviews of personnel with knowledge of the site's history; and
- Site historical sources review: aerial photographs, Sanborn Fire Insurance Maps, and business directories.

5.0 SITE DESCRIPTION

5.1 *Site Location and Legal Descriptions*

Site Name: City of Troutdale & Eastwind Development LLC Parcels
Site Address: 410 NE Harlow Road (a.k.a. 410 NE 257th Way); Tax Lot 400
320 NE Harlow Road (a.k.a. 320 NE 257th Way); Tax Lot 500
302 NE Harlow Road (a.k.a. 302 NE 257th Way); Tax Lots 100, & 600
City: Troutdale, OR
County: Multnomah County
Size: 19.6 acres
Tax Lot: See above
Township: 1 North *Range:* 3 East *Section:* 25
Willamette Meridian, (USGS Camas, Wash.—Oreg., 7.5' Quadrangle).

5.2 *Physical Setting*

The site is located immediately west of the Sandy River, which flows in a northwesterly direction past the site. The Sandy River connects with the Columbia River about 1.75 miles north of the site. The City of Troutdale is located to the north, west, and south of the site. The site elevation is approximately 30 to 40 feet above mean sea level (msl). The “old” town of Troutdale is located just to the south of the site, rising in elevation to approximately 250 feet (along parts of Troutdale Road). The topography in the vicinity of the site slopes slightly to the north-northwest, toward the Columbia River, but the topography in the vicinity of the site is relatively flat. The inferred direction of regional groundwater flow is to the north or northeast, toward the Sandy River, based on the topography (USGS Camas, Wash.—Oreg., 7.5' Quadrangle). It should be noted that site-specific groundwater flow may fluctuate based on local geology, local well use, and seasonal variations.

5.3 *Available Radon Data*

Radon is a radioactive gas, which occurs naturally in the environment and cannot be seen, smelled, or tasted. The human-health effect associated with exposure to elevated levels of radon is an increased risk of developing lung cancer. The U.S. EPA and US Centers for Disease Control are concerned about the increased risk of lung cancer developing in individuals exposed to above average levels of radon in their homes or offices. In order to address these concerns, the U.S. EPA conducted a radon survey and presented the results for all counties in 1990.

U.S. EPA’s map of Radon Zones assigns each of the counties in the United States to one of three zones. The zone designations were determined by assessing five factors that are known to be important indicators of radon potential: indoor radon measurements, geology, aerial radioactivity surveys, soil parameters, and foundation types.

The Multnomah County site falls within the designation of Zone 2. Zone 2 counties have a predicted average indoor radon screening level between 2 picocuries per liter (pCi/l) and 4 pCi/l. On the basis of the survey results, the “living area” results averaged 1.53 pCi/l and the “basement” results averaged 2.63 pCi/l, which fall below the action level of 4 pCi/l.

Details of area radon information are provided in the Environmental Data Resources (EDR) report in Appendix B.

6.0 CLIENT PROVIDED INFORMATION

6.1 Information (if any) Reported by User

The client provided Kleinfelder site location information prior to commencing work. This information assisted Kleinfelder in identifying the site location, site contacts, and site borders. City of Troutdale provided Kleinfelder the contact for gaining information regarding the site history. The contacts were Jim Galloway (City of Troutdale Public Works Director), Mike Sorensen (Wastewater Services Superintendent), and Debra Bosworth (representative for Eastwind Development LLC). Kleinfelder did not have direct contact with Junki Yoshida.

6.2 Specialized Knowledge or Experience

Kleinfelder had not conducted work on this site prior to this Phase I ESA.

7.0 HISTORICAL USE INFORMATION

The following information regarding past and current uses of the site and adjoining properties was obtained from various public and private sources. Information available through these sources is usually incomplete but may provide a general outline of the site's historical uses.

7.1 *City Directories*

City directories are useful for researching past site occupants by address for various years where directories are available. City directories are typically researched at five-year intervals. Polk's City Directories did not list the site addresses for the directories researched between 1966 and 1996 for the following addresses: 410, 320, and 302 NE Harlow and 410, 320, and 302 NW 257th Way. The lack of information from the resource could be considered a *data gap*, as defined by ASTM E 1527. However, given the time period that the research covered, Kleinfelder does believe the other historical sources provide sufficient overlapping information for this Phase I ESA.

7.2 *Sanborn Fire Insurance Maps*

Sanborn Maps were drawn by the Sanborn Fire Insurance Company to assist in underwriting properties from the late 1800s to the mid 1900s. For certain time intervals, the maps show much detail of buildings, improvements, and land uses. However, the coverage of this resource is typically limited to older districts in established towns and cities. Sanborn Maps were available for a portion of the site in 1901, 1909, 1925, and 1931 (Appendix A):

1901: The Sanborn Map shows the southern portion of the site as developed for and occupied by Union Meat Company's Abattoir (slaughterhouse). The property included the following features

- corrals and pasture
- road (unimproved Harlow Road)
- scale house
- shed west of corrals (unidentified use)
- loading platforms along rail spur
- "oil room" shed located at end of spur line
- pump house located in the "river bottom" area adjacent to the Sandy River (presumably this was at a lower elevation than the slaughterhouse)

The following features were located in the main slaughterhouse building that was located adjacent to the rail spur:

- killing floor (under roof)
- refrigeration room
- hide salting and storage area

- steam kettles and rendering room
- ammonia condenser
- three boilers
- cistern

The following features were located in the long, narrow building located at the top of the Sandy River bank (from south to north). The purpose of the building appeared to be related to the slaughterhouse operation.

- sweat room
- washing and pressing room
- water tower
- glue room
- fertilizer room
- warehouse
- small shed

There were “irregular cord wood” piles north of the fertilizer building. The purpose of the wood storage appears to be fuel for the slaughterhouse boilers.

1909 The Sanborn Map generally depicted similar site use as the 1901 map. Additional information indicated that sheds had been constructed in the corral area for cattle, hogs, and sheep. The shed west of the corrals noted in the 1901 map was used for “boarding.” There also appeared to be three cabins located on the west and north sides of the stock yard. The main slaughterhouse indicated an additional (fourth) boiler. Some of the rooms indicated slightly different uses: laundry on third floor and cold storage on second floor of main warehouse. An addition to the building included additional kettles.

The “oil house” noted in 1901 was no longer present. The “oil house” was apparently moved into the pump house (about 75 feet north of the old location), which was shown on the 1901 map. A 25,000-gallon water tank was located adjacent to the new oil house location. There was a 10,000-gallon water tank in the southeastern corner of the site.

A new building indicated lime and acid storage. The building was located west of the previously noted long, narrow warehouse/fertilizer building. In 1909, this building was labeled with the following activities: wool pulling and bailing; glue factory; and fertilizer cooking, drying, and packing.

1925 The site configuration appears to have changed. The main site building was indicated to be adjacent to the rail spur, in a general east-west orientation. The building was labeled: Bissinger and Company, wool pullery. The coverage of the 1925 Sanborn Map did not show the previously described site buildings. It appears that the old slaughterhouse had undergone refurbishment or

reconstruction. The cattle, hog, and sheep sheds and the fertilizer/glue factory buildings may have been removed since they were not shown or covered by the Sanborn Map.

1931 The 1931 map was generally unchanged from the 1925 Sanborn Map.

7.3 *USGS Quadrangle Map*

USGS quadrangle maps can indicate very generalized land use information over a specific time interval. Kleinfelder reviewed the Camas, Wash.—Oreg. 7.5-minute quadrangle. The map was first drawn in 1961 and photorevised in 1970 and 1975. Photorevisions are color-coded in purple.

1961 The site was indicated to have a long, narrow warehouse located immediately north of a east-west Union Pacific Railroad line. A spur line served the on-site warehouse. The map indicates there was a water tower on-site. An unimproved road had crossed the railroad and winds northward across the site then along the top of the bank for the Sandy River. The road terminated just south of Interstate 84, which is an east-west interstate highway. This unimproved road appears to have been an extension of Harlow Road. The properties located south of the site appeared to be commercial type land uses.

1970/1975 Additional buildings had been constructed on the 410 and 320 NE Harlow Road properties (wastewater treatment plant). Two structures shown as round dots could be clarifiers that were in use by the City of Troutdale Wastewater Treatment Plant. A small warehouse had been constructed near the railroad track and west of the large warehouse noted on the 1961 map.

7.4 *Aerial Photography Review*

A review of historical aerial photography may indicate past activities at a property not documented by other means, or observed during a property visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Available aerial photographs providing coverage of the site were obtained from the U.S. Army Corps of Engineers in Portland, Oregon, and Metro's online GIS map. The following is a tabulation of the aerial photographs reviewed:

Date	Flight/Photo #	Scale	Color	Stereo
September 3, 1935	---	1:16,000	B/W	No
June 29, 1948	--- (1948 floor photo)	1:6,000	B/W	No
July 22, 1955	---	1:20,000	B/W	No
September 28, 1968	---	1:6,000	B/W	No
May 3, 1972	---	1:24,000	B/W	No

Date	Flight/Photo #	Scale	Color	Stereo
September 15, 1983	---	1:24,000	Infrared	No
February 9, 1996	--- (2/96 flood photo)	1:24,000	Color	No
July 2004	Metro-Region.org	---	Color	No

The results of our aerial photography review are presented below.

- 1935 The site was a combination of fields, warehouse buildings, and a rural residence. The fields covered most of the site except the southeastern quarter and the northeastern corner of the site. The site appeared to be served by a rail spur adjacent to the site's southern border. Harlow Road (unpaved) intersects the Union Pacific Railroad and then meanders across the site to the northeastern corner. The large warehouse structure is consistent with the 1931 Sanborn Map. There were two separate outbuildings west of the warehouse. A circular pond was located to the west of the warehouse (still present on-site). A water tower was located on the north side of the warehouse. No other "wool pullery" buildings were apparent. At the northeastern corner of the site, there was a rural dwelling. Downtown Troutdale was located south of the railroad. A warehouse was located south of the railroad and the site.
- 1948 The wool pullery buildings were generally unchanged from the 1935 aerial photograph. The rural dwelling (and two outbuildings) were still present on-site. A significant amount of ground disturbance was evident along the old Harlow Road, a couple branches east of the wool pullery, and another heading to the northwest. The reason for the disturbance was not indicated elsewhere in Kleinfelder's research, but our speculation is that the "branches" appear to be a levee system. Since the 1948 photograph was taken just after the 1948 Flood, it was apparent that the Sandy River did not reach the "levee" that was under construction. There were indications of the initial footing construction of the Interstate 84 bridge over the Sandy River, north of the site.
- 1955 The potential levee system noted in 1948 was only partially evident. The wool pullery and residential buildings were still present. Some of the fields appeared to have been cultivated. Interstate 84 and the associated bridge over the Sandy River was shown.
- 1968 A new warehouse had been constructed on-site, west of the wool pullery building. The construction of this smaller warehouse included a graded parking area between the two warehouses. A large, circular pond had also been constructed between the water tower and the Sandy River. There was evidence of a clarifier associated with the large warehouse. The three farm buildings were

still located in the northeastern corner of the site. Access to the farm buildings consisted of a new unpaved road across the site's northern border. This is the current northern alignment of NW 257th Way. A greater amount of the fields on-site showed evidence of hay cultivation. A second bridge for Interstate 84 had been constructed over the Sandy River.

- 1972 The 1972 aerial photograph showed the beginnings of development for the Troutdale WWTP in the northern half of the subject site. The two circular ponds and the water tower were still present on-site. Harlow Road was still evident on-site, but as an unpaved road. Warehouses were still present south of the railroad and the site.
- 1983 The early stage of the WWTP consisted of the aeration basin, a clarifier, chlorine contact basin, digester, and a sludge storage lagoon. The warehouse buildings were still present in the southern portion of the site. The aerial photograph showed various unidentified materials storage to the north and west of the large warehouse. The large circular pond appeared to have been filled, though there was still evidence of its former location. The rail spur was still present, but did not appear to be in use.
- 1996 The aerial photograph indicated that the WWTP had been expanded. The old sludge ponds had been filled and replaced with a larger pond in the southwestern corner of the site. The two old warehouses were still present. The Factory Outlet stores had been developed on the property to the west of the site.
- 2004 The site is generally shown as what was observed during the site reconnaissance in November 2005. The downtown core of Troutdale (south of the site) had been redeveloped for commercial retail and office uses.

NOTE: Aerial photographs only provide information on indications of land use and no conclusions can be drawn from the photographs alone. Stereo pairs are not typically available in the Army Corps of Engineers collection because the flight lines do not necessarily follow straight lines. In addition, the digital copies of aerial photography Kleinfelder requests for review and backup documentation do not readily allow for stereo pairs at consistent scales.

7.5 Chain-of-Title Report

A chain-of-title was not provided for review within the timeframe of this project.

7.6 Current Use and Ownership of the Property

The site is currently owned by:

City of Troutdale:

410 NE Harlow Road (a.k.a. 410 NE 257th Way); Tax Lot 400
320 NE Harlow Road (a.k.a. 320 NE 257th Way); Tax Lot 500

The site is currently used by the City of Troutdale for Facilities and Maintenance as an office and storage yard. The WWTP was shut down in November 2001 because a new WWTP had been constructed north of the Troutdale Airport.

Eastwind Development LLC

302 NE Harlow Road (a.k.a. 302 NE 257th Way); Tax Lots 100, & 600

The smaller warehouse is leased to a woodworker. The large warehouse is vacant and has been condemned by Gresham Fire and Emergency Services.

7.7 Interviews

410 and 320 NE Harlow Road/NW 257th Way

On November 16, 2005, Kleinfelder met with Mr. Mike Sorensen (Wastewater Services Superintendent) and James Galloway (City of Troutdale, Public Works Director). Mr. Sorensen has been involved with the WWTP since 1983.

The City of Troutdale purchased two parcels around 1969. The previous land use was farmland and a residence. The WWTP was built in 1969 with upgrade expansions in 1979 and 1992. Mr. Sorensen remembered that the City of Troutdale Parks Department occupied an old farmhouse on the property until it was demolished in the late 1980s or early 1990s. The WWTP was closed in November 2001. Since 2002, the City of Troutdale Parks and Facilities Department has utilized the shop building, the northern warehouse, a couple sheds, and some exterior storage areas.

The WWTP had previously used chlorine gas as a disinfectant in 150-pound cylinders and lube oil. Mr. Sorensen and Mr. Galloway knew of no underground storage tanks (USTs), aboveground storage tanks (ASTs), or dry wells.

There were two groundwater monitoring wells for dewatering around the clarifiers. The purpose of the dewatering was to protect the clarifiers. The wells were installed in 1969 and 1979. The clarifiers are about 15 feet deep. The facility is connected to the municipal water supply. There were no on-site septic systems associated with the WWTP.

Mr. Sorensen believes that Portland General Electric owns the on-site transformers.

The City of Troutdale knew of no environmental liens, judgments, citations, violations, or lawsuits related to the WWTP.

Mr. Sorensen stated that there have been pre-treatment ordinances by the City of Troutdale in place for several years that limit what wastewater can be discharged to the

City system. There are also Federal Clean Water Act limits that pre-date the City ordinances. Mr. Sorensen stated that the Reynolds Aluminum plant, which is north of the site, was not connected to the municipal system or the WWTP. Mr. Sorensen also stated that the large warehouse on the Eastwind Development site (302 NE Harlow/NW 257th Way) had its own clarifier.

Between 1969 and the late 1980s, the WWTP accepted septic waste by truck. The septic waste, by nature, was more concentrated than the waste that the WWTP received by pipe in the municipal system. For a time, there was a tenant (Wastewater Management, Inc.) that operated a separate septic pre-treatment business on-site (320 NE Harlow). The operations used chlorine treatment prior to discharge to the WWTP. The business had occasional problems with the WWTP that resulted in the WWTP shutting off their discharge in at least one instance.

A 21-inch pipeline enters the facility and is connected to the headworks, which is the preliminary pre-treatment. The wastewater is then routed to the primary clarifier then secondary clarifier. The next step is the digester. Treated water is then used for land application or routed to the disinfection basin. The WWTP disinfected treated wastewater with chlorine up until 1994. After 1994, the WWTP used ultraviolet light technology instead of the chlorine. Disinfected water was discharged to the river. Mr. Sorensen knew of no leaks or spills at the facility to soil or groundwater. However, sludge was discharged to an on-site settling pond. One of the WWTP expansions (1992) included closure of two unlined ponds and construction of a larger pond, which is still present.

Mr. Sorensen stated that there is still sludge present in the digesters and in the sludge lagoon. The WWTP is in the process of transporting the sludge off-site, and Mr. Sorensen is estimating the work will be complete by the Summer of 2006.

Mr. Sorensen believed that the depth to perched groundwater is approximately 6 feet in some areas of the facility.

302 NE Harlow Road/NW 257th Way

On December 13, 2005, Kleinfelder interviewed the tenant of the smaller warehouse located at 302 NE Harlow Road. It is Kleinfelder's opinion that Doug Jones, Lavivrus Woodworking, was the best available source for history of the Eastwind Development parcels because he has worked at this part of the site since 1997. Mr. Junki Yoshida, while a local resident, does not appear to have specific site history information, according to Kleinfelder's conversation with Ms. Debra Bosworth, Mr. Yoshida's representative.

Mr. Jones had heard that the site had been used as a ranch since the early 1900s and used for "winter sheep" processing. The warehouse was reportedly constructed in 1922. The large warehouse had an oil-fired boiler. Mr. Jones remembered there was

an approximately 300-gallon heating oil UST outside the western wall of the warehouse and north of the boiler room. He believes that the UST is still present. The clarifier had been present at the facility prior to 1972, according to Mr. Jones.

Mr. Jones stated that Don Bennett owned the 302 NE Harlow Road property between 1972 and 1991. The warehouse may have been vacant for a time prior to 1972. David Bennett owned the site from 1991 to 1999 or 2000. The Bennetts made cabinets, counter tops, and speaker boxes. Speaker manufacturing involved vinyl laminate. Mr. Jones stated that the housekeeping practices were considered to be "average." He does not remember that the woodworking businesses conducted much on-site finishing of products. Some speaker box manufacturing by a previous tenant may have included painting. Mr. Jones stated that most of the waste generated during the woodworking era was solid waste, which included used adhesive containers. Adhesive containers were not typically waste. Empty containers of adhesive were allowed to harden then they were disposed as solid waste.

Mr. Jones stated that he thought Mr. Yoshida owned the site since 2001. Mr. Yoshida and David Bennett may have had a mutual ownership interest between 2000 and 2003.

Mr. Jones does not remember DEQ involved with the 302 NE Harlow Road/NE 257th Way site.

On November 18, 2005, Kleinfelder followed up on information first mentioned by Mr. Galloway during our conversation about site history. Mr. Galloway remembered a project involving the U.S. Army Corps of Engineers (USACE) in 1993. Kleinfelder spoke with Mr. Dick Gamble of USACE. The 1993 project involved revetment (rock lining) of the Sandy River bank adjacent to the WWTP. During the excavation work, the contractor encountered buried waste on the bank. Ms. Jane Bolton, civil engineer for USACE, determined that the waste material was not a potential hazardous material issue. She documented the assessment in an August 13, 1993 memorandum, included in Appendix C. The August 1993 memorandum reported that the landfilled debris was 90-95% particleboard. Much of the material had a veneer finish, and other disposed materials included concrete, a tire, rubber gaskets, plastic containers, etc. Mr. Gamble stated to Kleinfelder that he did not believe the entire landfill had been excavated and disposed off-site.

8.0 RECORDS REVIEW

Public, agency, and company records are sources of information that may be useful in evaluating activities that may result in recognized environmental conditions. The following agencies, companies, and individuals were contacted for records concerning the subject property. Information obtained from these sources is presented in the following sections.

- U.S. Environmental Protection Agency (EPA): Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), National Priorities List (NPL), Emergency Response Notification System (ERNS), and Resource Conservation and Recovery Act (RCRA) databases
- Oregon Department of Environmental Quality (DEQ): Underground Storage Tank (UST) facilities, Leaking USTs, Confirmed Releases List (CRL), Environmental Cleanup Site Information (ECSI) database, and Solid Waste Active Disposal Permits databases
- Local Fire Department
- Local Building Division
- Oregon Water Resources Department, recorded well logs

8.1 Standard Environmental Record Sources

The following information was obtained from regulatory listings and contacted agencies and individuals. The databases reviewed by EDR and the associated areas of study are described below. EDR's report is included in Appendix B. The search distances from the site in the following sections are recommended by ASTM Standard E 1527-00. The EDR Radius report, attached, is compliant with ASTM E 1527-05, which was approved at the end of November 2005 and the All Appropriate Inquiry (AAI) regulation that is effective November 1, 2006.

It should be noted that the EDR Radius Map report occasionally lists facilities that are not within the search radius of the site due to poor location information in the source databases. Other facilities might be listed as "orphans" where the locations are not known and, therefore, they are not plotted. Kleinfelder might not review regulatory agency files for these facilities when: (1) Kleinfelder considers the information to not be readily ascertainable because the location of the facility can not be readily determined; (2) the off-site facility's impact to the site's soil and groundwater is unlikely due to the distance from the subject site; or (3) the number of files to be reviewed by Kleinfelder has been limited by the scope of work.

8.1.1 Federal

Environmental Protection Agency

The following lists from the Region 10 Office of the U.S. EPA were reviewed:

Federal NPL (National Priority List)

The NPL (Superfund) database is a subset of CERCLIS properties and identifies over 1,200 facilities for priority cleanup under the Superfund Program. There were no listed NPL facilities within 1.0 miles of the site.

Federal CERCLIS List

The CERCLIS list is a database of known and potentially hazardous waste facilities reported to the U.S. EPA by state and local agencies and the general public in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The CERCLIS database was reviewed for facilities within 0.5 miles of the site. There were no listed CERCLIS facilities within 0.5 miles of the site.

Federal RCRA List

The RCRA list identifies facilities that have obtained identification numbers from the U.S. EPA, which designate these businesses as generators, transporters, or storers/disposers of hazardous waste. Obtaining an identification number does not mean that any hazardous materials have been improperly handled at any of these facilities. The generator's list was reviewed for the site and adjacent facilities, and the Treatment, Storage, and Disposal (TSD) list was reviewed for facilities within 0.5 miles of the site. There were no TSD facilities within 0.5 miles of the site listed in the database.

The following facilities listed as RCRA generators were located on or adjacent to the site:

**D and D Manufacturing (Third Dimension)
302 NW 257th Way
SUBJECT SITE**

U.S. EPA summary information indicates that D and D Manufacturing was a Small Quantity Generator of hazardous waste. There were violations recorded:

TSD-Other Requirements: January 1992 determined; achieved compliance in April 1992. Enforcement Action: written informal in January 1992; Civil Action for Imminent Hazards in April 1992 (proposed monetary penalty).

Generator-General Requirements: December 1991 determined; achieved compliance in April 1992. Enforcement Action: written informal in January 1992; Civil Action for Imminent Hazards in March and April 1992 (proposed monetary penalty).

D and D Manufacturing was fined \$2,100 for two violations. Further detail was not available.

Columbia Gorge Factory Stores

450 NW 257th Avenue

Adjacent to the west

The facility was listed as a Small Quantity Generator of hazardous waste. There were no violations reported.

Federal CORRACTS

The Corrective Action Report (CORRACTS) developed by U.S. EPA identifies hazardous waste handlers with RCRA corrective action activity. The database did not list facilities within 1.0 miles of the site.

Federal Emergency Response Notification System

The ERNS database records and stores information on reported releases of oil and hazardous substances. The database was checked for records of emergency responses for the subject site. No such listings were found.

8.1.2 State

The following summarizes the information obtained from the State of Oregon. Specified search distances are those identified in the ASTM standard.

Environmental Cleanup Site Information System (ECSI)

The ECSI system includes facilities entered into the DEQ database pursuant to the site discovery requirements of ORS 466.560. The list includes facilities where there has been a confirmed release of hazardous substances, facilities where investigation or cleanup has been initiated, and facilities suspected of a release of hazardous substances. The search radius for facilities listed in this database is 0.5 miles. One ECSI facility was located within the search radius for the database:

AAR Western Skyways

Troutdale Airport

Approximately 0.5 miles north of the site

The facility (aircraft maintenance) was listed on both the ECSI and the Confirmed Release List (CRL). The DEQ summary information indicates there were six 530-gallon USTs that contained used oil, paint thinner, spent solvents, and gasoline. Releases of solvents, either be surface releases or poured in a pipe drain, had reportedly occurred at the facility. In 1986, an UST that contained methylene chloride overflowed, spilling approximately 100 gallons. DEQ was notified but no action was initiated by DEQ. An independent investigation found that soils had been contaminated with cyanide, lead, chromium, and chlorinated solvents. The contamination and USTs were reportedly removed in 1990, but without oversight by DEQ. The facility was placed on the CRL after the cleanup had apparently occurred. DEQ has required a state level Preliminary Assessment. Because the facility is located downgradient of the subject site, further review of the facility file is not warranted.

Summary of Confirmed Release List (CRL)

This database is a listing of facilities by DEQ that are contaminated with hazardous wastes, petroleum products, and other hazardous substances. This database was reviewed for facilities on or within 1.0 miles of the site. Facilities picked up on this database are included on the ECSI database. The following CRL facility was located within the search radius for the database:

AAR Western Skyways

Troutdale Airport

Approximately 0.5 miles north of the site

See previous paragraph for detailed discussion.

Leaking Underground Storage Tank Incident Reports

This DEQ database is a listing of below-ground releases from petroleum underground storage tank (UST) systems or reportable surface spills. The list also includes aboveground releases to water which result in a sheen. The search radius for facilities listed in this database is 0.5 miles. There were 15 facilities within the search area listed on this database. None of the listed facilities were located immediately upgradient of the subject site and were considered to be a potential recognized environmental condition to the subject site. Kleinfelder does not believe further file review is warranted.

Registered Underground Storage Tank List

This DEQ database lists facilities with registered USTs in operation and decommissioned USTs. The search radius for facilities listed in this database is the site and adjoining properties. No registered USTs are listed for the subject site or the adjacent properties.

The heating oil UST that is reportedly located on the 302 NE Harlow subject property was not listed with DEQ because it is exempt.

State Landfill and/or Solid Waste Disposal Site Lists

No state landfills and/or solid waste disposal sites were located within 0.5 miles of the subject property. Although the site was not officially listed as a landfill site, comments from the USACE and Mr. Galloway indicate land filling has occurred at the site.

8.2 Well Logs, Fire Department, and Local Building Department

Oregon Water Resources Department

The Oregon Water Resources Department maintains records of well logs installed in the state of Oregon. The Department's records of the well logs are extensive; however, they do not necessarily reflect the actual number of water wells within the state.

There were two well logs recorded for the site. The well logs indicated that two monitoring wells (presumably temporary) were advanced to 12.5 feet adjacent to the water tower, which is north of the large warehouse. The wells were drilled in October 1994 by Paul Stroup. The geology is described as gravel fill in the upper 2 feet, underlain by "moist brown sand" between 2 and 8 feet bgs, and "wet brown sand" between 10 and 12.5 feet bgs. The holes were reportedly sampled then filled with bentonite.

City of Troutdale Building Department

The Building Department maintains records of building permits within the City. Building permits are not issued for USTs within the City. The following information was provided by the Building Department:

410 NW 257th Way, City of Troutdale, (Old Treatment Plant “Vacant”):

November 1978: Building permit for “new sewage treatment plant”
July 1980: Building permit for chlorine storage
February 1982: Grading permit for “fill”
April 1983: Building permit for alteration
April 1992: Building permit for expansion
June 1994: Building permit for sodium hypochlorite pretreatment
June 2003: Building permit for greenhouse

320 NW 257th Way, City of Troutdale, (Facilities Maintenance):

June 1984: Building permit for sludge drying bed
February and March 1992: Development permit for paving and parking lot
August 1994: Building permit to modify drying bed
January 1996: Building permit to pave

302 NE [sic] 257th Way, Eastwind Development LLC, Yoshida Group (current owner):

July 1974: Building permit for re-roof
May 1979: Building permit for roof
January 1984: Building permit for storage building
October 1984: Building permit for addition
May 1992: Plumbing permit for storm line
October 1994: Public Works permit for back flow
November 1994: Building permit for cell phone antenna
November 1994: Plumbing permit for dry well storm line

The location of the dry well shown in the November 1994 plumbing permit record was not indicated.

City of Gresham Fire Department

The City of Troutdale contracts with the Gresham Fire & Emergency Services for fire protection within the city. According to Fire Marshall Gus Lian, the only hazardous material issues known were chemical containers noted in the large warehouse at 302 NE Harlow Road when the building was condemned by Gresham Fire. Mr. Lian knew of no emergency responses to hazardous material incidents at the site. Gresham Fire’s records did not indicate the presence of USTs at the site.

City of Portland, Bureau of Development Services

A septic system could have been associated with the former farmhouse that was located in the northeastern corner of the WWTP property. There is no indication, at this

time, that when the City of Troutdale demolished the old farmhouse sometime between 1983 and 1996 a septic system had been abandoned. The address of the old farmhouse is not known. Mr. Phillip Crawford of the Sanitation Division of BDS stated that there were no records of septic systems on the site. Mr. Crawford stated that decommissioning records are generally maintained for the last seven years.

9.0 INFORMATION FROM SITE RECONNAISSANCE

A property visit was conducted on November 18, 2005, for the City of Troutdale properties and December 1, 2005, for the Eastwind Development properties. The purpose of the property visit was to look for obvious visual indications of historical or current operations that may have resulted in possible soil and/or groundwater contamination. The site visit included a visual evaluation of the grounds for indications of hazardous-waste storage and disposal areas, storm drainage, underground and aboveground storage tank locations, and hazardous-material storage and use areas. The site visit also included a general visual assessment of the potential presence of building materials suspected to contain asbestos. Refer to Figure 2, the Site Map, for locations of features referenced in this section.

9.1 Site and Vicinity Characteristics

City of Troutdale, 410 and 320 NW 257th Way / NE Harlow Road

The site was developed as a wastewater treatment plant (WWTP) by the City of Troutdale. The WWTP had been shut down due to the development of a new plant north of the site. The City of Troutdale Parks and Facilities Department was using six of the buildings (office/shop, three storage sheds, greenhouse, and the steel warehouse). The Police Department may also be using the grounds to store a few vehicles. According to Mike Sorensen, the WWTP still has operational components such as the capability to pump storm water from the sludge pond, aeration basin, and clarifiers.

The Parks and Facilities Department staff uses one of the site buildings for a combination office and shop. The shop had two flammables storage cabinets that contained gasoline. The staff employee stated that used oil collected for small engine servicing is collected in a drum and periodically taken off-site for recycling. Vehicle service work is conducted off-site. On the north side of the shop are three storage sheds, two of which are used to store pesticides and paint. A Parks staff employee stated that used pesticide containers and empty backpack sprayers are rinsed either on or off-site depending on the circumstances.

Kleinfelder's interview of Mr. Sorensen (summarized in Section 7.7) provides a brief description of the former WWTP operation, including a description of a former tenant's (Purifax) treatment operation on-site. Please refer to Section 7.7 for a description of the former WWTP's general operation.

Currently, various buildings (warehouse, laboratory, and digester building) and other structures (headworks, primary and secondary clarifiers, aeration basin, UV treatment/disinfection basin, digester, etc.) were still present on the subject site. The former chlorine contact basin (last used as UV disinfection treatment) formerly utilized chlorine gas to disinfect treated water prior to discharge to the river. Chlorine was

received in cylinders and used up in the process. There was no waste residue generated. UV lamps were cleaned occasionally with phosphoric acid.

The site's topography is generally flat with the exception of a large (one-million gallon) sludge storage lagoon. The lagoon is no longer in use, but it has collected storm water. Exterior portions of the WWTP facility were planted with some annual grasses, trees, and shrubs.

Eastwind Development LLC, 302 NW 257th Way / NE Harlow Road

A large warehouse was located in the south central portion of the Eastwind Development property. Reportedly, this building was constructed around 1922. Loading docks were located on the north and south sides of the warehouse. A rail spur adjacent to the southern loading platform appeared to be mostly overgrown with vegetation. Kleinfelder was able to view some areas of the eastern portion of this warehouse. However, because Gresham Fire had condemned the large warehouse, Kleinfelder did not have access to the western and central portions (including the boiler room) of the warehouse. Kleinfelder considers the inaccessibility of the site's main building as a data gap. In an effort to partially mitigate for the data gap, Kleinfelder requested information about the interior condition by Gus Lian of Gresham Fire. Mr. Lian indicated some chemical containers were noted during their inspection of the building. Moreover, Gresham Fire and City of Portland Fire have both used the building for training purposes, which may indicate that if leaking chemical containers were observed by personnel training on-site, the site owner would have been notified. Kleinfelder did note several chemical containers inside a door on the south wall of the building. The containers appeared to be organized into a limited area.

The large warehouse also had a boiler room on the western side of the building. A cut in the exterior concrete slab ran from the boiler room to a nearby vent pipe against the western wall. See below for discussion about the probability of a heating oil UST.

The smaller warehouse was occupied by a woodworking business, Lavivrus Woodworking. Mr. Doug Jones provided access to his shop on the date of the site visit. Kleinfelder noted storage of paints and thinners in the shop.

A small area of the property was a fenced compound where a cellular tower had been constructed. This is a leased area. The equipment in the compound appears to include a backup diesel generator, which is typical for such facilities. The diesel fuel is apparently stored in the equipment, aboveground.

Mr. Sorensen (City of Troutdale) indicated that he has observed two old clarifiers at the 302 NW 257th Way site. He believed the clarifiers may have been used during the days that the site operated as a wool pullery or slaughterhouse. One of the clarifiers (west of the large warehouse) contained large fish at one time. A chlorine "dispenser", piping,

pressurized cylinder, and two unlabeled 55-gallon drums were observed in a shed next to the northern clarifier.

The exterior portions of the Eastwind Development site consisted of gravel parking, concrete slabs (near the buildings), annual grasses, blackberries, and shrubs. Some debris piles were noted east of the gravel access road and north of the large warehouse. The debris consisted of wood and metal debris, some household furniture and appliances, and some tires. Not all parts of the debris piles were observed.

Kleinfelder viewed the eastern edge of the overall site as roughly the top of bank for the Sandy River.

The site was bounded by the following roads, improvements, or land uses:

<i>North</i>	Interstate 84; vacant land; Sandy River
<i>East</i>	Sandy River; Lewis & Clark State Park
<i>South</i>	Union Pacific Railroad; Old Troutdale (retail, office, restaurant land uses)
<i>West</i>	Troutdale Factory Stores (retail)

9.2 Descriptions of Structures, Roads and Other Improvements on the Site

City of Troutdale, 410 and 320 NW 257th Way / NE Harlow Road

Metal warehouse/shop: The Parks and Facilities Department used the building to store landscaping equipment (e.g., tractor, implements, other miscellaneous materials).

Digester Building: The building was centrally located and was formerly part of the wastewater treatment process at the facility. The digester was not operational. A sludge loading station was located outside the western side of the structure. The pumps in the building were electric and the boiler/heat exchangers were fired by natural gas. The building has a below grade level where some of the equipment is located.

Primary and Secondary Clarifiers: There are three clarifiers, which were circular pits partially filled with storm water. The clarifiers were not operational at the time of the site visit, but Mr. Sorensen stated that they have the capability of pumping out the storm water. Kleinfelder did not note obvious petroleum sheens on the water present in the clarifiers.

Aeration Basin: The aeration basin is an oval-shaped concrete-lined basin that was formerly used for secondary treatment of wastewater. Some standing water was present in the basin. Kleinfelder did not note obvious petroleum sheens on the water present in the basin.

Vac-on Station: The small area of the site located just east of the metal warehouse was used to collect sand grit. A storm drain is connected to the WWTP underground plumbing.

Chlorine Contact Basin: This basin was located on the eastern side of the WWTP. It was originally used to disinfect treated water prior to discharge to the Sandy River. The WWTP retrofitted the basin with UV lamp treatment system. This improvement includes a wash station for the UV lamps, which were occasionally cleaned with phosphoric acid. The cleaning solution was plumbed to the WWTP, according to Mr. Sorensen. The contact basin had collected some storm water. Kleinfelder did not note a petroleum sheen in the contact basin.

Laboratory Building: This small, square-shaped building on the eastern side of the treatment plant was formerly used by WWTP staff to analyze wastewater samples. Currently, the building appears to be used to store tools, supplies, some cleaning compounds, a can of paint, and two quarts of oil. The building had a concrete slab.

Sludge Storage Lagoon: A large, 1-million gallon lined sludge storage lagoon is located in the southwestern portion of the WWTP property. The pond no longer receives sludge from the WWTP, but the lagoon is partially filled with storm water. Kleinfelder did not note a petroleum sheen in the contact basin. The former sludge ponds (100,000-gallon capacity) were located to the west of the digester building and north of this lagoon. The former sludge ponds were filled to grade and planted with grass.

Parks & Facilities Office/Shop (320 NW 257th Way): This building is currently occupied by the City of Troutdale Parks & Facilities and is used as an office and shop. The building was formerly used by the Purifax tenant. Outside the building are two holding tanks that were formerly used for septic waste and treated waste. Septic waste was formerly transported to the 320 NW 257th Way parcel when the Purifax wastewater management business was in operation. The building had a concrete slab.

Drying Beds: Purifax constructed this structure for use for their former operation. A low concrete wall surrounds the drying beds. There is no roof. The old drying beds are no longer in use.

Eastwind Development, 302 NW 257th Way / NE Harlow Road

Small Steel Warehouse: There is a rectangular steel warehouse in the western portion of the 302 NW 257th Way property. The warehouse was constructed on a concrete slab. The warehouse has overhead doors. There is a small office in the building. The building was used by a woodworking business.

Large Abandoned Warehouse: There was a large warehouse located on the 302 NW 257th Way property. The building appeared to have been constructed in stages because there was steel-sided, brick, and concrete wall construction evident. Gresham

Fire and Emergency Services condemned the warehouse; therefore, Kleinfelder did not have access to the interior of the building. Some interior spaces were viewed through unsecured doors on the eastern side of the building. Kleinfelder noted timber framing, wood siding, and concrete floors. Portions of the building were more than two stories tall. The building had a boiler room on the western end of the building. Adjacent to the boiler room was a single-story office building. The boiler room and office was locked and inaccessible. A small well pump room was open on the western side of the building. There appeared to be a turbine pump attached to a wellhead.

The building had loading docks on the northern side of the building. A large, covered truck port was also located on the northern side of the building. Concrete slabs were present outside the building's western door, under the truck port, and at the loading dock.

A loading platform was located on the southern side of the building. An old rail spur ran parallel to the loading platform. The rail spur was overgrown with vegetation, but it appeared that the rail spur was concrete paved.

Water Tower and Cellular Antenna: A large, steel water tower was located north of the large warehouse. It was not known whether the tower contained water. There were cellular antennas on the water tower. A small, fenced compound was located at the base of the tower for the antenna control room and backup generator.

Clarifiers: There were two concrete clarifiers to the west and north of the large warehouse. The clarifier on the west appeared to be older and the equipment normally seen on clarifiers was no longer present. The clarifier to the north of the warehouse appeared to be associated with subsurface vaults and chlorine contact equipment in adjacent sheds. Kleinfelder observed pooled oil and oil staining on pump equipment located in the shed attached to the large warehouse. Kleinfelder speculates that the pump is part of a system that formerly pumped wastewater from floor troughs in the condemned warehouse to the clarifier.

9.3 Labeled Hazardous Substances Containers

Kleinfelder noted the following chemical containers on the site:

CHEMICAL	QUANTITY	STORAGE CONTAINER & LOCATION	USE	HOW IS WASTE DISPOSED?
Gasoline	<10 gallons	Gas cans in flammables storage cabinet in Parks and Facilities shop (320 NW 257 th Way)	Used in small engines for off-site activities	---
Used oil	<55 gallons	Steel drum in Parks and Facilities shop (320 NW 257 th Way)	Servicing small engines	Periodically sent to recycler
Paint	---	1-5 gallon containers in storage shed with concrete floor (320 NW 257 th Way)	Storage	Not indicated
Pesticides & herbicides	---	Various containers in storage shed with concrete floor (320 NW 257 th Way)	Storage; use is at off-site City of Troutdale properties; used with backpack sprayers	Containers rinsed either on or off-site
Cleaning solutions	Small quantity	Typical containers stored in laboratory building (410 NW 257 th Way)	Cleaning	Not indicated
Paint	<1 gallon	1-gallon paint can in laboratory building (410 NW 257 th Way)	Storage	Not indicated
Motor oil	<2 quarts	Two 1-quart oil containers in laboratory building (410 NW 257 th Way)	Storage	Not indicated
Various paints and thinner	<50 gallons	Various small containers up to 5-gallon buckets (302 NW 257 th Way)	Used in woodworking	Apparently used up in process. Used paint containers allowed to dry then disposed as solid waste
Gasoline	<2 gallons	2.5-gallon can in shop (302 NW 257 th Way)	---	---
Adhesive	---	Adhesive in 12-15 plastic tubes located in box trailer parked at loading dock (302 NW 257 th Way)	Apparent adhesive from former cabinet manufacturing	Abandoned in box trailer

There was a car battery on a wood pallet outside the small warehouse (302 NW 257th Way). A vehicle gas tank (apparently empty) was also stored on the pallet.

9.4 Unidentified or Unlabeled Substance Containers

Kleinfelder noted the following chemical containers on the site where the contents could not be identified:

VISUAL DESCRIPTION OF CONTENTS	QUANTITY	STORAGE CONTAINER & LOCATION	USE	WASTE
Possible rain water residue	<10 gallons	Four steel 55-gallon drums with open bung tops; located off northwest corner of large warehouse (302 NW 257 th Way)	Not apparent	Not apparent
Possible hydraulic oil	<20 gallons	Three 5-gallon containers located in open shed (with fire suppression riser) of large warehouse. Two box containers with hose fittings and oil stains (302 NW 257 th Way)	Stored. Former use may have been for pneumatic equipment/tools.	Proper disposal required
Hydraulic oil	<20 gallons	Possible wastewater pump east of truck loading dock; staining and pooled oil on pump parts (302 NW 257 th Way)	May have been related to former wastewater transfer from wool pullery to clarifier	Proper disposal required
Various chemical containers	<50 gallons	Up to 5-gallon sized containers located on concrete floor of large warehouse in condemned section (302 NW 257 th Way)	Not apparent	The containers appeared to have been consolidated at this location. Proper disposal required.
Unknown	<100 gallons (drums could be empty)	Two steel 55-gallon drums in chlorine equipment shed next to northern clarifier (302 NW 257 th Way)	Contents, if any, of drums not known	Proper disposal required

9.5 Chemical Storage Tanks

Kleinfelder observed a vent pipe attached to the western wall of the condemned warehouse (302 NW 257th Way). There was a concrete patch across the concrete pad from the general location of the vent pipe to the boiler room. Kleinfelder believes there is product piping for a fuel oil UST where the patched concrete was observed. Kleinfelder also believes that a fuel oil UST is present at the base of the vent pipe. Mr. Doug Jones of Lavivrus Woodworking thought an UST was still present at this location.

Kleinfelder also observed an abandoned gas cylinder in a shed next to the clarifier north of the large warehouse (302 NW 257th Way). This cylinder was present in the shed that had the chlorine gas equipment, presumably used for disinfection of wastewater. It was not known whether the cylinder in the shed contained chlorine gas.

9.6 Indications of PCBs

Some older electrical equipment, such as transformers and capacitors, occasionally contained cooling oil with polychlorinated biphenyls (PCBs). PCBs can also be present in old hydraulic oil.

Kleinfelder observed pad-mounted transformers at the WWTP plant. Mr. Sorensen believed that the transformers were owned by the electric utility. Pole-mounted transformers were located on the Eastwind Development site. The transformers did not appear to be leaking.

Kleinfelder observed fluorescent light fixtures in site buildings. Older, unlabeled light ballasts on the fixtures have the potential of containing PCBs.

Kleinfelder observed hydraulic oil related to the pump and the box reservoirs that are described in Section 9.4. Kleinfelder also observed a possible hydraulic lift ramp on the loading dock under a metal plate.

9.7 Land Conditions

City of Troutdale, 410 and 320 NW 257th Way / NE Harlow Road

Kleinfelder did not note soil staining or obvious indications of spills/releases of hazardous substances to the site soil. Kleinfelder did not note significant areas of stressed vegetation. This property is the former WWTP for the City of Troutdale; therefore, there are features about the property, such as the sludge storage lagoon, clarifiers, and aeration basin that received or treated wastewater.

Eastwind Development, 302 NW 257th Way / NE Harlow Road

Kleinfelder did note oil staining on pump equipment located in a shed attached to the large warehouse. Kleinfelder visited the site during the wet season; therefore, the potential for observing minor surface soil staining is reduced. Kleinfelder did not observe significant surface soil staining on the Eastwind Development property.

9.8 Wells, Septic Systems, and Wastewater Discharge

Both properties appear to be connected to the municipal water supply and sanitary sewer. Mr. Sorensen thought there is a possibility that an old septic system associated with the farmhouse (formerly located on the WWTP property) had been abandoned, but he could not confirm this information.

According to Mr. Sorensen, the warehouses on the Eastwind Development site were connected to the on-site WWTP. The Eastwind Development site was later connected to the new WWTP to the north. Presumably, warehouses on the Eastwind Development site were once connected to a septic system(s) or they once utilized their wastewater treatment system in lieu of a septic system.

According to Mr. Sorensen, the WWTP and the former farmhouse were connected to the City of Troutdale municipal water supply. Mr. Kevin Rauch of the City of Troutdale Water Division stated that there is a municipal water account for the 302 NE Harlow Road (NW 257th Way) property. The account is currently active. It was not clear whether the connection included the large warehouse. Kleinfelder observed a turbine pump in a pump room on the western end of the large warehouse, which indicates the presence of a water well.

Storm water at the WWTP was discharged to the municipal storm system through catch basins and underground piping. It is not known whether there is a municipal storm water connection at the Eastwind Development site. Kleinfelder did not note obvious dry wells on the site.

As mentioned above, there were two clarifiers located on the Eastwind Development site that presumably operated during the former wool pullery operation. The clarifiers would have been used for animal processing wastewater. In addition to the clarifiers, Kleinfelder observed two concrete vaults: (1) in the shed attached to the large warehouse and (2) an exterior vault, which were both near the northern clarifier. A ladder leads into the vault located in the shed. The use of the vaults was not apparent, but they could be related to the former wool pullery operation and the handling of wastewater.

9.9 Indications of Solid Waste Disposal

Kleinfelder did not observe obvious indications of solid waste disposal at the WWTP site. As mentioned above, some debris piles were noted east of the gravel access road and north of the large warehouse. The debris consisted of wood and metal debris, some household furniture and appliances, and some tires. Not all parts of the debris piles were observed.

9.10 Potential Presence of Asbestos-containing Building Materials

An asbestos survey has not been conducted for the site buildings. Kleinfelder noted building materials suspected to contain asbestos in the roofing, wallboard, and flooring materials.

9.11 Previous Environmental Report Data Review

Previous environmental reports for the site were not disclosed by this assessment.

10.0 REFERENCES

EDR provided available Sanborn Maps, which are included in Appendix A. Refer to the EDR report in Appendix B for detailed information regarding the regulatory agency database research. The EDR report includes an annotated description with dates for the databases reviewed. Appendix B also includes a copy of the City Directory Abstract.

Other references in this report are provided in the text as necessary.

11.0 PROFESSIONAL AUTHENTICATION

This report has been prepared and reviewed by the undersigned. **This report is void if original seal and signature are not present.**

Kleinfelder, Inc. (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report AS IS. Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

USER'S GUIDE

This User's Guide provides guidelines for accessing Sanborn Map® images and for transferring them to your Word Processor.

Reading Sanborn Maps

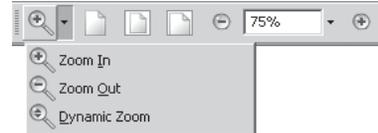

- Sanborn Maps document historical property use by displaying property information through words, abbreviations, and map symbols. The Sanborn Map Key provides information to help interpret the symbols and abbreviations used on Sanborn Maps. The Key is available from EDR's Web Site at: <http://www.edrnet.com/reports/samples/key.pdf>

Organization of Electronic Sanborn Image File

- Sanborn Map Report, listing years of coverage
- User's Guide
- Oldest Sanborn Map Image
- Most recent Sanborn Map Image

Navigating the Electronic Sanborn Image File

1. Open file on screen.
2. Identify TP (Target Property) on the most recent map.
3. Find TP on older printed images.
4. Using Acrobat® Reader®, zoom to 250% in order to view more clearly. (200-250% is the approximate equivalent scale of hardcopy Sanborn Maps.)
 - A. On the menu bar, click "View" and then "Zoom to..."
 - B. Or, use the magnifying tool and drag a box around the TP

Printing a Sanborn Map From the Electronic File

- EDR recommends printing images at 300 dpi (300 dpi prints faster than 600 dpi)
- To print only the TP area, cut and paste from Acrobat to your word processor application.

Acrobat Versions 6 and 7

1. Go to the menu bar
2. Click the "Select Tool"
3. Draw a box around the area selected
4. "Right click" on your mouse
5. Select "Copy Image to Clipboard"
6. Go to Word Processor such as Microsoft Word, paste and print.

Acrobat Version 5

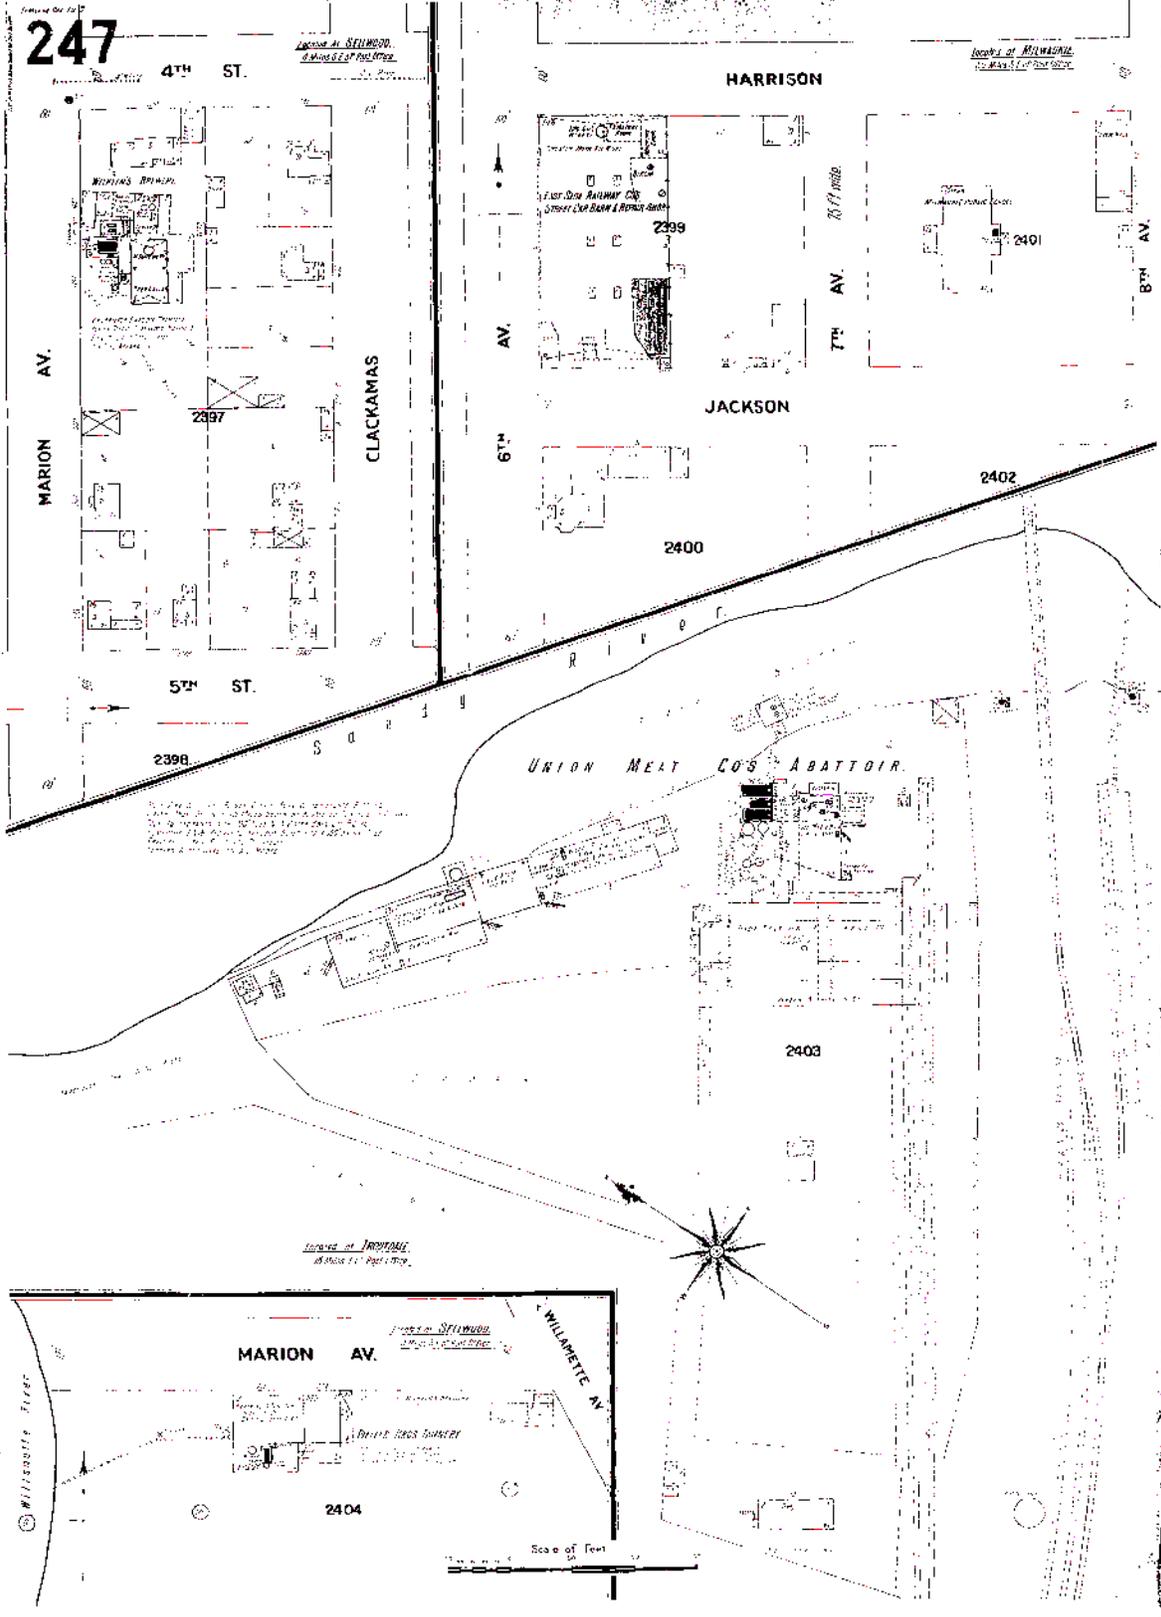

1. Go to the menu bar
2. Click the "Graphics Select Tool"
3. Draw a box around the area selected
4. Go to "Menu"
5. Highlight "Edit"
6. Highlight "Copy"
7. Go to Word Processor such as Microsoft Word, paste and print.

Important Information about Email Delivery of Electronic Sanborn Map Images

- Images are grouped into one file, up to 2MB.
- In cases where in excess of 6-7 map years are available, the file size typically exceeds 2MB. In these cases, you will receive multiple files, labeled as "1 of 3", "2 of 3", etc. including all available map years.
- Due to file size limitations, certain ISPs, including AOL, may occasionally delay or decline to deliver files. Please contact your ISP to identify their specific file size limitations.

FIRE DEPT.: Two Fire Stations with Equipment. Capacity of 1,000,000 Gallons Daily. Capacity of 1,000,000 Gallons Daily. Capacity of 1,000,000 Gallons Daily.

Union Meat Co.
This map shows the location of the Union Meat Co. abattoir. The abattoir is located on the east side of the city, near the Sandy River. The abattoir is a large industrial building with several smaller buildings nearby. The abattoir is surrounded by a fence and has a large parking area. The abattoir is a major source of meat for the city and is a significant part of the local economy.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

FEDERAL RECORDS

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store , treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facil

A review of the RCRA-SQG list, as provided by EDR, and dated 10/14/2005 has revealed that there are 4 RCRA-SQG sites within approximately 0.375 miles of the target property.

Comments: MOTOR HOME WAS FILLING WITH GASOLINE AT GAS STATION. THE PUMP HANDLE FAILED TO SHUT OFF AND IT WAS NOT NOTED UNTIL 90 GALLONS WERE RELEASED. GRESHAM FIRE ENGINE 75 ARRIVED AND CONSTRUCTED AN UNDERFLOW DAM IN THE EFFECTED WATERWAY. E73 ARRIVED AND APPLIED ABSORBANT PADS, KITTY LITTER, AND REMOVED IGNITION HAZARDS. NOTIFIED FACILITY TO CONTACT A CLEANUP COMPANY AND THEY COMPLIED.

Department Or Division Of Company:	FOR TROUTDALE OREGON
Facility Has Written Emergency Plan:	Yes
Company Name:	FLYING J TRAVEL PLAZA
Fire Dept Code:	0144
Physical State :	Not reported
Physical State Of The Substance:	LIQUID
Average Amount Possessed During The Year Code:	30
Description Of The Avg Qnty Code:	10,000-49,999
Maximum Amount Possessed During The Year Code:	31
Description Of The Max Qnty Code:	50,000-99,999
Applicable Unit Of Measure Code:	2
Description Of The Unit Of Measure:	GALLONS
Storage Container:	
Type Code:	B
Description:	UNDERGROUND TANK
Pressure of Hazardous Substance Code:	1
Pressure Description:	NORMAL PRESSURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	NORMAL TEMPERATURE
Days The Hazardous Substance Is On Site During Year:	365
Is The Substance Protected A Trade Secret:	No
United Nations/north America 4 Digit Classification Number:	1202
Chemical Abstract Service Identifier Number:	68476346
First Hazardous Classification Code For Chemical:	3.3
Hazard Classification 1 Of The Chemical:	Flammable Liq. (73F<FP<141F)
Second Hazardous Classification Code For Chemical:	6.3
Hazard Classification 2 Of The Chemical:	Acute Health Hazard
Third Hazardous Classification Code For Chemical:	6.4
Hazard Classification 3 Of The Chemical:	Chronic Health Hazard
Is Substance Pure Or Mixture:	Mixture
Hazard Rank:	2
Chemical Is An Extremely Hazardous Substance (ehs):	Not reported
Does The Chemical Contain A 112r Chemical:	No
Chemical Is A Toxic 313 Chemical:	No
EPA Pesticide Registration Number:	Not reported
Most Hazardous Ingridient:	PETROLEUM DISTILLATES
Contains 112R :	No
Contains EHS:	No
Contains 313:	Yes
Fertilizer:	No
Pesticide:	No
NAICS Code 1:	447110
NAICS Desc 1:	GASOLINE STATIONS WITH CONVENIENCE STORES
NAICS Code 2:	Not reported
NAICS Desc 2:	Not reported

AST:

Employer File Number: 022106
 Hazardous Substance: PROPANE
 Reporting Quantities: 500-999
 Quantity Units: GALLONS
 Physical State: GAS
 Storage 1: ABOVEGROUND TANK

HM3, E-75, 701 CALLED TO DIESEL SPILL AT FLYING J TRUCK STOP. ARRIVED AND FOUND SPILL OF 150 GALLONS OF DIESEL FUEL. HEAVY RAINS CAUSING FUEL TO BE SPREAD OVER LARGE AREA. HM3 & E-75 INVESTIGATED SPREAD OF FUEL, PLACED BOOMS IN DITCHES & NEAR STORM DRAIN OPENINGS TO CONTROL FLOW OF DIESEL TO MAJOR WATERWAYS LIKE COLUMBIA RIVER. PADS WERE PLACED UNDER TRUCK BY DRIVER AND TRUCK STOP PERSONNEL TO CONTROL RUN OFF. PRIOR TO OUR ARRIVAL, TRUCK DRIVER HAD CLOSED CROSS OVER LINE TO FUEL TANK TO STOP TOP FLOW PRIOR TO OUR ARRIVAL. HM INITIATED COMMUNICATIONS AND FACILITATED THEM WITH OARS, DEQ, OWNER GREG GAY IN VT, AND MANAGER OF FLYING J TRUCK STOP.

NARR Comments (8/4/92 KPD/SAS) Western Skyways operated an aircraft maintenance facility at the Portland-Troutdale Airport. Allegedly, used solvents were either dumped onto the open ground or poured down a drain pipe. By the 1980s, the solvents, oils,

and fuels were stored in underground storage tanks. A tank holding spent methylene chloride overflowed in 1986, spilling about 100 gallons. DEQ was notified but no action was taken due to the small size of the spill. A site inspection by Hahn and Associates in 1987 found soils contaminated with cyanide, lead, and chromium. Small amounts of chromium and lead were also in groundwater. A 1988 "environmental assessment" found low levels of chlorinated solvents (generally 10 to 150 ppb) in the soils. Abandoned Haz Waste Site Notebook; spill file; inspection reports; lab results; soil & groundwater investigation reports; UST decommissioning & contaminated soil removal reports (LUST log #26-87-0015). cyanide, chromium, trichloroethylene, lead; TPH May 1986 overflow/spill of 100 gallons of methylene chloride/wastewater mix. Also, allegedly poor waste-management practices. The site is located at the Portland-Troutdale Airport, north of Troutdale. A lake/marsh is located about a quarter-mile northwest of the site; the Sandy River is about a half mile east. The Reynolds Metal Superfund site (ECSI #154) is due north of the site. With the exception of the Reynolds facility, the area around the airport is largely empty. (8/4/92 KPD/SAS) The underground storage tanks and contaminated soil were removed in 1990. However, the cleanup was apparently performed without DEQ knowledge or supervision (the site was placed on the Confirmed Release List one year after the cleanup). Post-removal soil sampling revealed no detectable solvents, and TPH was <500 ppm (acceptable for a Matrix Level II cleanup). Cyanide, chromium, and lead were not sampled for. SAS recommends that a state Preliminary Assessment (PA) be performed to evaluate the sufficiency of the cleanup. Soil contamination. Used oil 2 (530-gal.) tanks; Paint thinner 2 (530-gal.) tanks; spent solvents 1 (530-gal.) tank; gasoline 1 (530-gal.) tank; aviation fuel 1 (1,040-gal.) tank.

NARR Comments (12/15/99 RGS/VCP) Several potential contaminant sources have been identified on-site including: 1) a sump/drainage ditch on the east side of the building that received wastes from the chemistry and engineering labs; 2) a solid waste landfill on the north end of the property; 3) oil discovered in April 1996, within the casing of the on-site water supply well; 4) a shallow drywell used for the disposal of viscous and possibly corrosive wastes; and 5) a former heating oil tank. COE has sampled soil and groundwater near the ditch, drywell and landfill area. Low levels of petroleum hydrocarbons PCBs, VOCs, and metals were detected in selected samples. Analytical testing of oil in the well show it to be a lubricating oil, which probably origin

ated from the pump removed from over the well.
EPA correspondence; Preliminary Assessment prepared by ACOE 6/24/91; "ERGO Assessment Report" (environmental audit) prepared by Woodward-Clyde Consultants 1/95; DEQ site visit 8/28/96; Baseline Environmental Survey Report prepared by Tetra Tech, November 1997; Supplemental Groundwater Investigation prepared by Tetra Tech, August 1998; Cleanup report prepared by Tetra Tech, May 1999; Draft Final "Site Investigation Report", URS, August 2002. "Removal Action Report - Landfill Removal", Farallon Consulting L.L.C., March 2004.
The Corps began using the site in July 1949 to test the engineering properties of soils and concrete. From 1985 - 1998, the facility also operated an analytical lab for VOCs, PAHs, and inorganics.
Metals, VOCs, petroleum hydrocarbons.
On-site infiltration of wastewater from the engineering testing laboratory (practice began about 1949 when the lab began operations, and ended in 1996 when the lab's wastewater effluent was connected to the sanitary sewer system); disposal of solid (and possibly other, unknown) wastes into a "landfill" on the north end of the property, between the 1950s and 1995; leakage of oil from pump into on-site well; on-site disposal of viscous waste into shallow drywell; release from on-site heating oil tank.
Soil and groundwater were investigated as potential pathways of concern. A water supply well existed on-site until 1998. The City of Troutdale operates several municipal wells within about 0.75 mile south of the site, and there are a number of industrial/irrigation wells 0.5 mile to the WNW (Reynolds Metals Co.). The Sandy River flows approximately 500 feet east of the site, but a levee stands between the site and the river, so that surface water runoff from the site is not likely to enter the river.
(12/15/99 RGS/VCP) The Corps of Engineers removed oil and water from the on-site well's casing prior to decommissioning the well in 1998. The Corps initiated independent characterization of soil & groundwater near the drywell, drainage ditch area and solid waste landfill in 1996. Based on results of this investigation, the COE independently removed soil in the vicinity of the drywell on a portion of the wastewater drainage ditch in 1999. (4/21/00 RGS/VCP) DEQ review of the independent investigation of cleanup indicated additional characterization is needed at the facility. (11/7/00 RGS/VCP) EPA NFRAP was rescinded 10/31/00. In a letter dated 10/23/00, EPA requested that the Corps of Engineers perform additional investigation at the site.
(4/2/01 RGS/VCP) COE submitted a preliminary Scope of Work (SOW) for additional investigation and a project schedule to EPA and DEQ in March 2001. (11/21/01 RGS/VCP) In May 2001, DEQ received a complaint that the NPD Lab may have tested soil from the Umatilla Army Depot and that site workers may have been exposed to the chemicals from UAD (e.g. nerve agents). DEQ and EPA requested additional information from the COE on this issue. Buckets of soil from UAD were discovered on-site and will be tested. In July 2001, the COE submitted a draft sampling plan to EPA and DEQ. The field investigation was conducted in September 2001. Results should be submitted to DEQ and EPA in early 2002. (12/23/02 RGS/VCP) The work plan for a site investigation (SI) was submitted to DEQ and EPA in September 2001. Field work was conducted

in the fall of 2001. The final draft SI report was submitted to DEQ in October 2002. DEQ comments on the report were sent to the COE in December 2002.

(06/16/05 RGS/VC

P) The COE cleaned the sump, removed contaminated ditch sediments, and removed the landfill debris from the site in the summer of 2003. Confirmation samples indicate that contaminants in on-site soil are below risk based concentrations.

A 30-day p

ublic comment period was held on the proposed NFA in May 2005. No comments were received. The NFA was issued in June 2005.

NARR Comments On Nov 11, 1980. Goodman Sanitation pumped 1800 gals of paint wastes from tanks at D & M Wood Products, Inc., (PO Box 20037, Portland, OR 97220). The waste was disposed of in a pit on property operated by Goodman Sanitation. The disposal location was the southern portion of the Goodman property, between a fence and two underground septic waste disposal tanks. Correspondence from owner and/or operator; Notice of Violation Letter; 6/29/94 phone conversation with Albert Mauck. paint thinners and paint residues Soil contamination, possible groundwater contamination. Pit dimensions were approximately 25 feet by 10 feet by 10 feet deep. Soon after the 1,800 gallons of paint waste and thinner were dumped at the site, the affected soils were excavated and allegedly disposed of in Arlington as a hazardous waste. Albert Hanson of the PUC collected and submitted a sample to the DEQ lab in 11/80, but no information is available on the sample location or analytical results. In addition no documentation remains of soil disposal at Arlington.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRA: Resource Conservation and Recovery Act Information

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients--States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

Date of Government Version: 12/29/04	Source: Department of Energy

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

ENG CONTROLS: Engineering Controls Recorded at ESCI Sites

Engineering controls are physical measures selected or approved by the Director for the purpose of preventing or minimizing exposure to hazardous substances. Engineering controls may include, but are not limited to, fencing, capping, horizontal or vertical barriers, hydraulic controls, and alternative water supplies.

Date of Government Version: 08/01/05
Date Data Arrived at EDR: 08/16/05
Date Made Active in Reports: 09/14/05

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY HISTORICAL DATABASES

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation

Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Daycare Centers: Child Care Listings

GEOCHECK[®] - PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

CITY OF TROUTDALE - EASTWIND PROPERTY
410 NE HARLOW
TROUTDALE, OR 97060

TARGET PROPERTY COORDINATES

Elevation: 43 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with EPA's Standards and Practices for All Appropriate Inquiries (AAI) and ASTM E 1527-05, Section 8.2.3.

Section 8.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK[®] - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

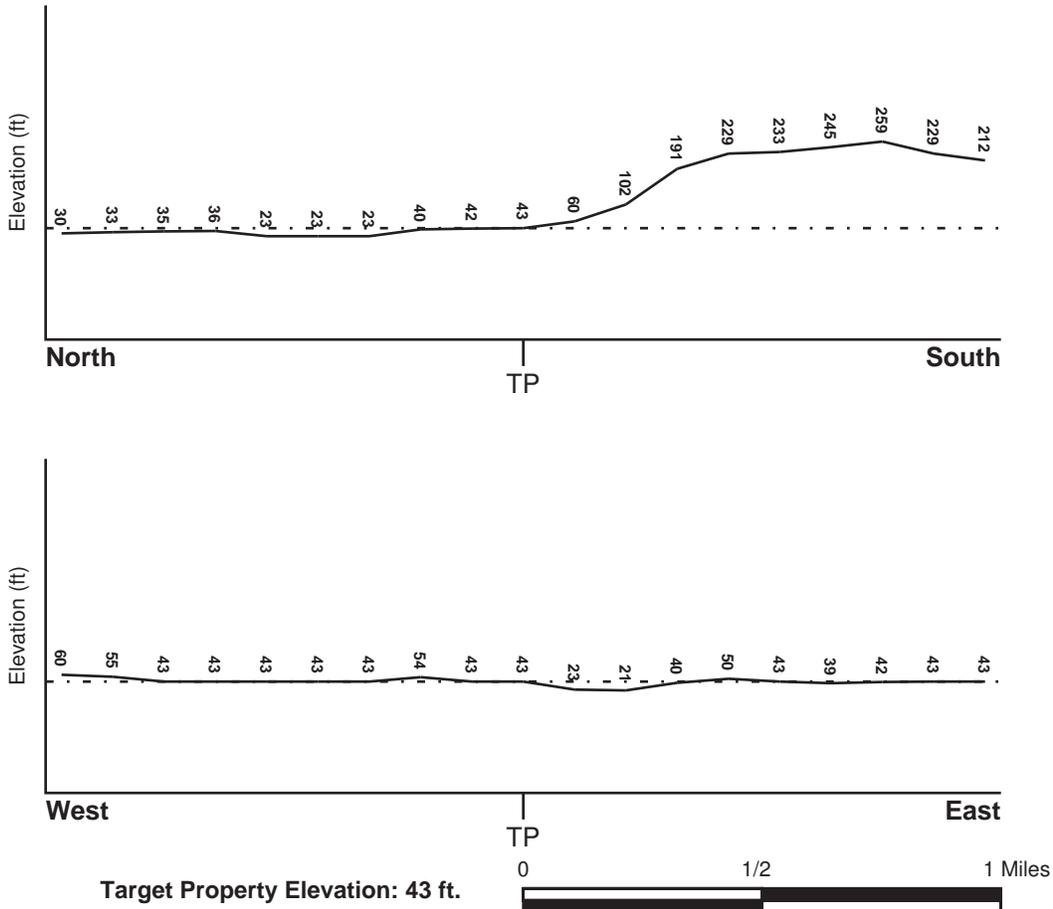

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map: 45122-E4 CAMAS, WA OR
 General Topographic Gradient: General NNE
 Source: USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> MULTNOMAH, OR	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property:	4101840005C
Additional Panels in search area:	4101790217B 4101790240A

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> CAMAS	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
---	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION</u> <u>FROM TP</u>	<u>GENERAL DIRECTION</u> <u>GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
System: Quaternary
Series: Quaternary
Code: Q (*decoded above as Era, System & Series*)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: SAUVIE

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Poorly. Soils may have a saturated zone, a layer of low hydraulic conductivity, or seepage. Depth to water table is less than 1 foot.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: MODERATE

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	15 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 0.60 Min: 0.20	Max: 6.50 Min: 5.60
2	15 inches	39 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 0.60 Min: 0.20	Max: 6.50 Min: 5.60
3	39 inches	60 inches	stratified	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 6.00 Min: 2.00	Max: 6.50 Min: 6.10

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loamy fine sand
fine sandy loam
sand
silty clay loam
loam
gravelly - loam

Surficial Soil Types: loamy fine sand
fine sandy loam
sand
silty clay loam
loam
gravelly - loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: gravelly - sand
loamy fine sand
fine sandy loam
silty clay
very gravelly - loamy coarse sand

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

According to ASTM E 1527-05, Section 8.2.2, "To enhance and supplement the standard environmental record sources in 8.2.1, local records and/or additional state or tribal records shall be checked when, in the judgment of the environmental professional, such additional records (1) are reasonably ascertainable, (2) are sufficiently useful, accurate, and complete in light of the objective of the records review (see 8.1.1), and (3) are generally obtained, pursuant to local good commercial or customary practice, in initial environmental site assessments in the type of commercial real estate transaction involved." One of the records sources listed in 8.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. The city directory is a sophisticated tool for locating individuals and businesses. With each address, the directory lists the name of the corresponding occupant.

References

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints, and practically reviewable.*

EPA's Standards and Practices for All Appropriate Inquiries (AAI), Section § 312.24, identifies the historical sources of information necessary to achieve the objectives and performance factors of § 312.20. According to AAI, *"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."*

Data Gaps

In order to address data gaps, additional sources of information may be consulted. According to the AAI, Section § 312.20 (g), *"to the extent there are data gaps (as defined in § 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, *"historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."*

Thank you for your business.

Please contact EDR at 1-800-352-0050
with any questions or comments.

City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. The city directory is a sophisticated tool for locating individuals and businesses. With each address, the directory lists the name of the corresponding occupant.

References

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints, and practically reviewable.*

EPA's Standards and Practices for All Appropriate Inquiries (AAI), Section § 312.24, identifies the historical sources of information necessary to achieve the objectives and performance factors of § 312.20. According to AAI, *"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."*

Data Gaps

In order to address data gaps, additional sources of information may be consulted. According to the AAI, Section § 312.20 (g), *"to the extent there are data gaps (as defined in § 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, *"historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."*

Thank you for your business.

MEMORANDUM FOR RECORD

SUBJECT: Trip Report, Sandy River Bank Revetment Construction

1. A site visit to the Sandy River Bank Revetment Construction was conducted on Thursday, 12 August 1993. The purpose of the visit was to examine trash and debris unexpectedly encountered during bank excavation to determine whether any hazardous, toxic, or radiological waste (HTRW) was potentially present.

2. I arrived at the site at approximately 12:10. The trash has been piled at the top of the bank on both sides of a temporary dirt access road leading from the top of the bank down to almost river level. I walked over the piles examining the material. Approximately 90-95% of the material is particleboard, most with a veneer finishing, starting to decompose at the edges. In the easternmost pile there is an area of what appears to be cement, some of which is very weakly fused, possibly by percolating rainwater. Other observed items were one tire, 2 rubber gaskets, a crushed WD-40 spray can, 4 or 5 crushed empty buckets (volumes of 2-5 gallons, labels missing or unreadable), several empty small (approximately 1 quart) plastic containers which probably held consumer automotive products (part of a Valvoline label was attached to one such container), a length of rebar, several pieces of plastic sheeting, a few small tar balls, and what appeared to be a metal Shelby tube filled with soil. I left the site at approximately 12:50.

3. On the basis of this surface examination (there is the possibility other materials could be buried within the piles), there is not a potential HTRW problem at this site. All the observed materials may be either landfilled or recycled.

Dear Mr. Galloway:

Kleinfelder is pleased to submit this report that summarizes the field activities and findings of a Phase II Environmental Site Assessment conducted at the above-referenced site in Troutdale, Oregon. We trust that the information contained in this report will meet your needs at this time.

Kleinfelder appreciates the opportunity to be of service on this project. Should you require additional information or have any questions regarding this report, please contact this office at your convenience.

Sincerely,

KLEINFELDER, INC.

1.0 INTRODUCTION

This report describes the field activities and findings of a Phase II Environmental Site Assessment (ESA) conducted on March 16, 2006, at the City of Troutdale Wastewater Treatment Plant (WWTP) property and Eastwind Development, LLC (Eastwind Development) property in Troutdale, Oregon (Figure 1). The assessment was conducted in accordance with applicable local, state, and federal laws and was performed in general accordance with the American Society of Testing and Materials (ASTM) Standard E 1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*, and Kleinfelder's Work Plan dated January 30, 2006. The objective of the Phase II ESA was to assess potential impacts to soil with respect to the potential environmental concerns identified in Kleinfelder's Phase I ESA (Kleinfelder, 2006).

The scope of work described in this report consisted of the following: decommissioning of a commercial underground heating oil tank (HOT), excavation of ten test pits, collection and analysis of soil samples, and data analysis and interpretation.

2.0 SITE DESCRIPTION

The site is located in the southeast quarter of the northwest quarter of Section 25, Township 1 North, Range 3 East, Willamette Meridian, Multnomah County, Oregon (U.S. Geological Survey, 1975). The site is bounded to the north by NW frontage Road and commercial businesses, to the south by Union Pacific Railroad, to the east by the Sandy River, and to the west by NW 257th Way and commercial businesses (Figure 1). The "old" town of Troutdale is located just south of the site across Union Pacific Railroad.

The site consists of three adjoining properties located at 410, 320, and 302 NW 257th Way in Troutdale, Oregon (Figure 2). The properties located at 410 (Tax Lot 400) and 320 (Tax Lot 500) NW 257th Way are owned by the City of Troutdale. The old WWTP located at 410 NW 257th Way was shut down in November 2001 because a new WWTP had been constructed north of the site.

The property located at 302 NW 257th Way (Tax Lots 100 and 600) is owned by Eastwind Development. Two warehouses are located in the southwestern portion of Tax Lot 100. The small warehouse has been leased to a woodworker, and the large

warehouse (former wool pullery) is vacant and has been condemned by Gresham Fire and Emergency Services.

The site is essentially level, and topography in the site vicinity slopes gently to the northeast towards the Sandy River, which borders the east side of the site. The Sandy River flows in a northwesterly direction past the site and joins the Columbia River approximately 1.75 miles north of the site. The site elevation is approximately 30 to 40 feet above mean sea level. The inferred direction of regional groundwater flow is to the northeast, toward the Sandy River, based on topography (U.S. Geological Survey, 1975).

3.0 BACKGROUND

Kleinfelder conducted a Phase I ESA for the site at the request of the City of Troutdale (Kleinfelder, 2006). The following background information has been summarized from the Phase I ESA.

City of Troutdale WWTP Property

The City of Troutdale WWTP property was initially developed, at least in the southwestern portion, as a boarding building for employees of the Union Meat Company's slaughterhouse in 1901. In 1969, construction of the WWTP began after the City of Troutdale obtained ownership of the property. The WWTP has a former, approximately 100,000-gallon capacity, unlined sludge storage lagoon (see Figure 2 for location of the lagoon). There is a potential that the soil beneath the unlined lagoon could have accumulated concentrations of metals and semi-volatile organic compounds (SVOCs).

There were reportedly no releases of hazardous substances to the soil or groundwater at the City of Troutdale property. There were no known underground storage tanks (USTs) at the property.

Eastwind Development Property

In 1901, two warehouses were constructed in the southwestern portion of Tax Lot 100 by Union Meat Company. The warehouses were used for processing livestock, including a rendering and glue plant. Two "oil house" buildings were present east of the large warehouse, presumably to store oil containers for onsite machinery.

The present-day Eastwind Development property had changed many times between its original construction in 1901 and the shut down of the wool pullery around 1970;

however, the business use of the property during that period appears to have remained consistent as a slaughterhouse, hide processor, and/or wool pullery.

There is a potential that the former slaughterhouse activities (tanning) may have resulted in the presence of chromium and volatile organic compounds (VOCs) in site soil and in sediment from the onsite clarifiers. A settling pond was located north of the large warehouse that could have been used for wastewater discharge after primary treatment in the onsite clarifiers.

D&D Manufacturing/Third Dimension operated at the present-day Eastwind Development property from the early 1970s to the late 1990s. The business was considered a "Small Quantity Generator" of hazardous waste under the Resource Conservation and Recovery Act (RCRA). There were violations reported by the U.S. Environmental Protection Agency (EPA) for citations that had occurred during 1991-1992. The details of the violations were not known, but they were likely due to waste storage practices and/or administrative issues. For example, several chemical containers, from plastic tubes to 55-gallon drums, with unidentified liquids were observed at the property during the Phase I ESA activities. The presence of chemical containers is considered an environmental concern. Additionally, the cabinet making business likely used adhesive and resins. Other than the listing for D&D Manufacturing/Third Dimension as a RCRA Small Quantity Generator, the present-day Eastwind Development property was not listed on the various federal and state environmental cleanup databases researched for the Phase I ESA.

4.0 SITE GEOLOGY AND HYDROGEOLOGY

The site is situated in the Sandy River Delta. The site vicinity is underlain by Quaternary-aged Missoula flood deposits consisting of silt, sand, cobbles, and boulders. These flood deposits are underlain by Tertiary-aged Troutdale Formation, which consists of partially cemented conglomerate and sandstone (Rapp, 2005).

Soils encountered by Kleinfelder during excavation activities at the site generally consisted of silty sand underlain by sand with cobbles and boulders. Groundwater was not encountered during the excavation activities at the site.

5.0 PHASE II ENVIRONMENTAL SITE ASSESSMENT

On March 16, 2006, the Phase II ESA activities included the following: 1) at the City of Troutdale WWTP property - collection of soil samples from two test pits; and 2) at

Eastwind Development property - geophysical survey, decommissioning of an underground HOT and collection of soil samples, and collection of soil samples from eight test pits.

A backhoe excavator was used to decommission the underground HOT and excavate the test pits. The HOT was located west of the large warehouse at the Eastwind Development property. The test pit locations were selected based on the known site history and results of the geophysical survey discussed in Section 5.2.1. The HOT and test pit locations are shown in Figure 2. Groundwater was not encountered in the HOT excavation and test pits during excavation activities. A licensed HOT supervisor was present and observed the HOT decommissioning, field operations, collected samples, and logged the test pits. Test pit logs are provided in Appendix A.

Soil samples were placed in ice-chilled coolers and transported under chain-of-custody documentation to Specialty Analytical in Tualatin, Oregon for analysis. Following collection of soil samples, the HOT excavation and test pits were backfilled with the excavated soils.

5.1 CITY OF TROUTDALE WWTP PROPERTY

Two test pits (TP-1 and TP-2) were excavated to approximately 5.5-6 feet below the ground surface (bgs) within the apparent boundary of the former unlined sludge lagoon. No visual or olfactory evidence of impacts were detected in soils from these test pits. One soil sample was collected from each test pit for laboratory analysis.

5.2 EASTWIND DEVELOPMENT PROPERTY

The activities conducted at Eastwind Development property are described in the following subsections.

5.2.1 Geophysical Survey

On March 16, 2006, GeoPotential, located in Gresham, Oregon, conducted a geophysical survey using a magnetometer in the area east and north of the large warehouse. The survey was conducted for the purpose of detecting metallic debris that could be remnants of the foundations of three buildings (two "oil houses" and a large building) historically occupying this portion of the site, as well as detecting possible waste drums.

Eleven magnetic anomalies (A through K; see Figure 2 of the geophysical survey report provided in Appendix B) were detected during the survey. Anomaly A was interpreted

to be caused by a small metallic object that may be a drum(s) or other metallic debris. Anomaly B was also interpreted to be caused by a small metallic object; however, later excavation at Anomaly B location unearthed a concrete pad overlying malodorous soil containing oil. Anomaly C, when excavated, showed similar characteristics as Anomaly B without the oil. Anomalies B and C appeared to be the locations of the former two "oil houses". Anomaly D appeared to be a broken up foundation pad or a debris zone. Anomalies E, G, H, and I appeared to be caused by small metallic objects that may be debris or drums. Anomaly F, when excavated during the survey, was found to be caused by scattered drywall nails. Anomaly J was interpreted to be caused by small and scattered metallic objects. Anomaly K, when excavated during the survey, was found to be caused by miscellaneous metallic debris. A copy of the geophysical survey report is provided in Appendix B.

5.2.2 HOT Decommissioning

An approximately 675-gallon underground HOT was decommissioned by removal in general accordance with Oregon Department of Environmental Quality (DEQ) regulations. Petroleum hydrocarbon odor or staining was not observed in excavated backfill material or in native soil exposed along the excavation sidewalls and floor. Groundwater was not encountered during decommissioning activities. Two soil samples were collected from beneath the two ends of the HOT after its removal. The excavation was backfilled with the excavated soils.

5.2.3 Test Pit Excavation

Eight test pits (TP-3 through TP-10) were excavated north and east of the large warehouse. The test pits were excavated to depths ranging from 9 to 15 feet bgs, and were intended to assess soil at historic locations with potential environmental concerns (i.e., former oil houses, settling pond, and glue factory) and areas interpreted/determined to contain metallic debris during the geophysical survey. One soil sample was collected from each test pit for laboratory analysis. Two onsite clarifiers and drainage trenches inside the former slaughterhouse/large warehouse did not have sufficient sediment; therefore, sediment samples were not collected from these locations.

Test pit TP-3 was excavated within the apparent boundary of the former settling pond. No visual or olfactory evidence of impacts was detected in soils from test pit TP-3. Test pits TP-4 and TP-5 were excavated at the locations of magnetic anomalies C and B,

respectively, that were believed to be the sites of the former oil houses. The following materials were found beneath the buried concrete pad in test pits TP-4 and TP-5: black fibrous material (of unknown source, possibly building material or animal hair), viscous sludge(s) and oily liquids of unknown origin or composition, with an extremely strong, undetermined odor that could be smelled several hundred feet away. Test pits TP-6 and TP-7 were excavated at the locations of magnetic anomalies K and J, respectively, that were interpreted to be caused by metallic debris. In test pit TP-6, trash was found; a soil sample was collected from beneath the trash. In test pit TP-7, two corroded, buried drums with undetermined contents were found. Test pits TP-8, TP-9, and TP-10 were excavated in the area of the former glue factory. In test pits TP-8 and TP-9, buried wood/fiberboard debris was found; soil samples were collected from beneath the debris. In test pit TP-10, green rubbery material, possibly related to the glue factory or some other unknown source, was found; a soil sample was collected from beneath the rubbery material.

5.3 SOIL SAMPLE ANALYTICAL TEST METHODS

The analytical program for soil samples was developed based upon historic site operations. Samples were analyzed for one or more of the following constituents: petroleum hydrocarbon identification by Northwest Method NWTPH-HCID; diesel- and lube oil-range petroleum hydrocarbons (diesel and lube oil) by Northwest Method NWTPH-Dx; VOCs by EPA Method 8260B; SVOCs by EPA Method 8270D; total RCRA-8 metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) by EPA Method 6010/7471; e. coli by EPA Method 503D; fecal coliform by EPA Method 9222D; enteric viruses by ASTM Method D4994-89; and helminth ova by EPA Method 600/1-87/014.

Samples collected from the HOT excavation were analyzed for diesel and lube oil. Samples collected from test pits TP-1 and TP-2 were analyzed for SVOCs and RCRA-8 metals (total). The sample collected from test pit TP-1 was also analyzed for e. coli, fecal coliform, enteric viruses, and helminth ova. A sample collected from test pit TP-3 was analyzed for VOCS, SVOCs, and RCRA-8 metals (total). Samples collected from test pits TP-4 and TP-5 were analyzed for diesel, lube oil, VOCS, SVOCs, RCRA-8 metals (total), e. coli, and fecal coliform. Samples collected from test pits TP-6 and TP-7 were analyzed for petroleum hydrocarbon identification. The sample collected from test pit TP-6 was also analyzed for RCRA-8 metals (total). The sample collected from test pit TP-7 was also analyzed for VOCs and SVOCs. Samples collected from test pits

TP-8, TP-9, and TP-10 were analyzed for petroleum hydrocarbon identification. The sample collected from test pit TP-10 was also analyzed for diesel, lube oil, VOCS, SVOCs, and RCRA-8 metals (total). A copy of the laboratory report and chain-of-custody documentation is provided in Appendix C.

5.4 REGULATORY SCREENING LEVELS

A detailed conceptual site model (CSM) of potentially complete exposure pathways is not part of the approved scope of work and, accordingly, has not been completed for this site. However, based on our current knowledge of site conditions, *soil ingestion, dermal contact, and inhalation* for occupational, construction worker and excavation worker receptors; and *vapor intrusion into buildings and volatilization to outdoor air* for an occupational receptor appear to be potentially complete exposure pathways for soil at the site. Based on this preliminary CSM, analytical results of the petroleum hydrocarbon-related constituents in soil samples were compared to their respective generic risk-based concentrations (RBCs) listed in Appendix A of the DEQ's *Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites* (RBDM) guidance document (DEQ, 2003) for the above potentially complete exposure pathways. The generic RBCs used for comparison are listed in Table 1. Analytical results of the petroleum hydrocarbon-related constituents in soil samples for which generic RBCs have not been determined by DEQ (2003), were compared to the EPA Region 9 preliminary remediation goals (PRGs) for industrial soil (EPA, 2004). Analytical results of metals in soil samples were compared to the EPA Region 9 PRGs for industrial soil. The PRGs used for comparison are listed in Tables 1 and 2.

6.0 SUMMARY OF SOIL SAMPLE ANALYTICAL RESULTS

Analytical results of petroleum hydrocarbon identification, total petroleum hydrocarbon quantification (diesel and lube oil), VOCs, and SVOCs in soil samples are summarized in Table 1. Analytical results of metals, e. coli, fecal coliform, enteric viruses, and helminth ova in soil samples are summarized in Table 2.

6.1 City of Troutdale WWTP Property

Barium (ranging from 5.02 to 5.05 milligrams per kilogram (mg/Kg)) and chromium (ranging from 4.36 to 4.91 mg/Kg) were detected in soil samples collected from test pits TP-1 and TP-2. The detected barium and chromium concentrations are well below their respective EPA Region 9 PRG cleanup levels for industrial soil. SVOCs, e. coli, fecal coliform, enteric viruses, and helminth ova were not detected at or above their

respective laboratory method reporting limits (non-detect) in soil samples collected from test pits TP-1 and TP-2.

6.2 Eastwind Development Property

The soil sample results from the assessment of the Eastwind Development property are summarized in the following subsections.

6.2.1 HOT Decommissioning

Diesel and lube oil were non-detect in soil samples collected from the HOT excavation.

6.2.2 Former Settling Pond

Barium (21.8 mg/Kg) and chromium (2.8 mg/Kg) were detected in a soil sample collected from test pit TP-3. The detected barium and chromium concentrations are well below their respective EPA Region 9 PRG cleanup levels for industrial soil. VOCs and SVOCs were non-detect in the soil sample collected from test pit TP-3.

6.2.3 Former Oil Houses

The following constituents were detected in soil samples collected from test pits TP-4 and/or TP-5: diesel (ranging from 25,800 to 28,600 mg/Kg); lube oil (ranging from 7,450 to 9,810 mg/Kg); 2-hexanone (ranging from 0.0713 to 0.221 mg/Kg); 1,4-dichlorobenzene (ranging from 0.469 to 2.76 mg/Kg); 2-butanone (0.201 mg/Kg); acetone (ranging from 1.26 to 11.4 mg/Kg); carbon disulfide (0.0684 mg/Kg); chlorobenzene (0.011 mg/Kg); toluene (0.0162 mg/Kg); total xylenes (0.0593 mg/Kg); naphthalene (ranging from 0.18 to 21.7 mg/Kg); 2-methylnaphthalene (1.5 mg/Kg); 3- & 4-methylphenol (ranging from 5.75 to 61.7 mg/Kg); phenol (ranging from 53.6 to 140 mg/Kg); arsenic (14.9 mg/Kg); barium (ranging from 21.8 to 51.3 mg/Kg); cadmium (0.102 mg/Kg); chromium (ranging from 1.11 to 2.8 mg/Kg); lead (11.0 mg/Kg); and mercury (0.0336 mg/Kg).

The detected diesel concentrations in soil samples collected from test pits TP-4 and TP-5 are above the generic RBC cleanup level for the *construction worker soil ingestion, dermal contact, and inhalation* exposure pathway (23,000 mg/Kg). The detected arsenic concentrations in soil samples collected from test pits TP-4 and TP-5 are above the EPA Region 9 PRG cleanup level for industrial soil (1.6 mg/Kg). The DEQ has determined that the maximum background soil concentration of arsenic in Oregon is 12 ± 2.84 mg/Kg (DEQ, 1994). Arsenic concentrations detected in soil samples collected from test pits TP-4 and TP-5 are comparable to the above background concentration.

The detected concentrations of the remaining constituents are well below their applicable generic RBC or EPA Region 9 PRG cleanup levels.

6.2.4 Former Glue Factory

Petroleum hydrocarbons were non-detect in soil samples collected from test pits TP-8 and TP-9. The following constituents were detected in a soil sample collected from test pit TP-10: diesel (30.1 mg/Kg); lube oil (141 mg/Kg); methylene chloride (0.0938 mg/Kg); benzoic acid (0.678 mg/Kg); bis(2-ethylhexyl)phthalate (6.09 mg/Kg); di-n-octylphthalate (0.284 mg/Kg); barium (20.9 mg/Kg); chromium (4.46 mg/Kg); lead (7.88 mg/Kg); and mercury (0.028 mg/Kg). All the detected constituent concentrations are well below their applicable generic RBC or EPA region 9 PRG cleanup levels.

6.2.5 Other Locations

Petroleum hydrocarbons were non-detect in a soil sample collected from test pit TP-6. Arsenic (2.33 mg/Kg), barium (28.8 mg/Kg), chromium (9.77 mg/Kg), lead (14.9 mg/Kg), and mercury (0.0198 mg/Kg) were detected in the soil sample collected from test pit TP-6. The following constituents were detected in a soil sample collected from test pit TP-7: 1,1,1-trichloroethane (6.27 mg/Kg); 1,1-dichloroethene (0.256 mg/Kg); tetrachloroethene (0.0371 mg/Kg); trichloroethene (0.0782 mg/Kg); and bis(2-ethylhexyl)phthalate (1.15 mg/Kg).

The detected arsenic concentration in the soil sample collected from test pit TP-6 is slightly above the EPA Region 9 PRG cleanup level for industrial soil; however, the detected arsenic concentration is well below the maximum background soil concentration of arsenic in Oregon as discussed in Section 6.2.3.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations are based on Kleinfelder's knowledge of the subject property from site observations and information gathered during the Phase II ESA activities. The conclusions and recommendations are subject to the limitations presented in this report and may change if additional information becomes available.

A preliminary CSM has identified *soil ingestion, dermal contact, and inhalation* for occupation, construction worker, and excavation worker receptors; and *vapor intrusion into buildings and volatilization to outdoor air* for an occupational receptor as being potentially complete exposure pathways for soil at the site.

7.1 CITY OF TROUTDALE WWTP PROPERTY

Barium (ranging from 5.02 to 5.05 mg/Kg) and chromium (ranging from 4.36 to 4.91 mg/Kg) were detected in soil samples collected from test pits TP-1 and TP-2 excavated within the apparent boundary of the former unlined sludge lagoon. The detected barium and chromium concentrations are well below their respective EPA Region 9 PRG cleanup levels for industrial soil. SVOCs, e. coli, fecal coliform, enteric viruses, and helminth ova were non-detect in soil samples collected from test pits TP-1 and TP-2. No additional soil investigation or cleanup in this locality is recommended at this time.

7.2 EASTWIND DEVELOPMENT PROPERTY

7.2.1 HOT Decommissioning

Diesel and lube oil were non-detect in soil samples collected from the HOT excavation. This suggests that there does not appear to be a significant release associated with the underground HOT at the site. No additional soil investigation or cleanup in the former HOT vicinity appears warranted at this time. A HOT decommissioning report will be submitted to the DEQ.

7.2.2 Former Settling Pond

Barium (21.8 mg/Kg) and chromium (2.8 mg/Kg) were detected in a soil sample collected from test pit TP-3 excavated within the apparent boundary of the former settling pond. The detected barium and chromium concentrations are well below their respective EPA Region 9 PRG cleanup levels for industrial soil. VOCs and SVOCs were non-detect in the soil sample collected from test pit TP-3. No additional soil investigation or cleanup in this locality appears warranted at this time.

7.2.3 Former Oil Houses

The following constituents were detected in soil samples collected from test pits TP-4 and/or TP-5 excavated at the locations of the former oil houses: diesel (ranging from 25,800 to 28,600 mg/Kg); lube oil (ranging from 7,450 to 9,810 mg/Kg); 2-hexanone (ranging from 0.0713 to 0.221 mg/Kg); 1,4-dichlorobenzene (ranging from 0.469 to 2.76 mg/Kg); 2-butanone (0.201 mg/Kg); acetone (ranging from 1.26 to 11.4 mg/Kg); carbon disulfide (0.0684 mg/Kg); chlorobenzene (0.011 mg/Kg); toluene (0.0162 mg/Kg); total xylenes (0.0593 mg/Kg); naphthalene (ranging from 0.18 to 21.7 mg/Kg); 2-methylnaphthalene (1.5 mg/Kg); 3-&4-methylphenol (ranging from 5.75 to 61.7 mg/Kg); phenol (ranging from 53.6 to 140 mg/Kg); arsenic (14.9 mg/Kg); barium (ranging from

21.8 to 51.3 mg/Kg); cadmium (0.102 mg/Kg); chromium (ranging from 1.11 to 2.8 mg/Kg); lead (11.0 mg/Kg); and mercury (0.0336 mg/Kg).

The detected diesel concentrations in soil samples collected from test pits TP-4 and TP-5 are above the generic RBC cleanup level for the *construction worker soil ingestion, dermal contact, and inhalation* exposure pathway (23,000 mg/Kg). The detected arsenic concentrations in soil samples collected from test pits TP-4 and TP-5 are above the EPA Region 9 PRG cleanup level for industrial soil (1.6 mg/Kg). The DEQ has determined that the maximum background soil concentration of arsenic in Oregon is 12 ± 2.84 mg/Kg (DEQ, 1994). Arsenic concentrations detected in soil samples collected from test pits TP-4 and TP-5 are comparable to the above background concentration. The detected concentrations of the remaining constituents are well below their applicable generic RBC or EPA Region 9 PRG cleanup levels.

Recommendations for the area east and north of the large warehouse in general, which includes the former oil houses and former glue factory, have been made in Section 7.2.6.

7.2.4 Former Glue Factory

Test pits TP-8, TP-9, and TP-10 were excavated in the area of the former glue factory. Petroleum hydrocarbons were non-detect in soil samples collected from test pits TP-8 and TP-9. The following constituents were detected in a soil sample collected from test pit TP-10: diesel (30.1 mg/Kg); lube oil (141 mg/Kg); methylene chloride (0.0938 mg/Kg); benzoic acid (0.678 mg/Kg); bis(2-ethylhexyl)phthalate (6.09 mg/Kg); di-n-octylphthalate (0.284 mg/Kg); barium (20.9 mg/Kg); chromium (4.46 mg/Kg); lead (7.88 mg/Kg); and mercury (0.028 mg/Kg). The detected constituent concentrations are well below their applicable generic RBC or EPA Region 9 PRG cleanup levels.

7.2.5 Other Locations

Test pits TP-6 and TP-7 were excavated northeast of the large warehouse. Petroleum hydrocarbons were non-detect in a soil sample collected from test pit TP-6. Arsenic (2.33 mg/Kg), barium (28.8 mg/Kg), chromium (9.77 mg/Kg), lead (14.9 mg/Kg), and mercury (0.0198 mg/Kg) were detected in the soil sample collected from test pit TP-6. The following constituents were detected in a soil sample collected from test pit TP-7: 1,1,1-trichloroethane (6.27 mg/Kg); 1,1-dichloroethene (0.256 mg/Kg); tetrachloroethene (0.0371 mg/Kg); trichloroethene (0.0782 mg/Kg); and bis(2-ethylhexyl)phthalate (1.15 mg/Kg). The detected arsenic concentration in the soil sample

collected from test pit TP-6 is slightly above the EPA Region 9 PRG cleanup level for industrial soil; however, the detected arsenic concentration is well below the maximum background soil concentration of arsenic in Oregon as discussed in Section 7.2.3.

7.2.6 Recommendations for the Area North and East of the Large Warehouse

Black fibrous material of unknown source; and viscous sludges and oily liquids of unknown origin or composition, with an extremely strong, undetermined odor were found beneath the buried concrete pad (foundation of the former oil houses) in test pits TP-4 and TP-5. In test pit TP-7, two corroded, buried drums with undetermined contents were found. In test pit TP-10, green rubbery material, possibly related to the former glue factory or some other unknown source, was found. Kleinfelder recommends that additional laboratory testing be performed to identify the above substances so that they can be adequately characterized for safe handling and for potential disposal purposes. The potential analyses to be performed are being discussed with the laboratory, and specific analyses have yet to be determined. These analyses could potentially cost an additional \$1,000 to \$2,000.

Additional work should be performed to excavate the buried drums and debris, and investigate the remaining magnetic anomalies. This work will facilitate removal of the metallic debris from the subsurface, collection of buried containers for subcontractor disposal, and a better estimate of potential soil, sludge, and debris that may require excavation and disposal at an approved landfill facility. The additional cost for this work is estimated to be \$2,500 to \$3,500; and may vary depending on the additional laboratory analyses performed and any subsequent special handling or other considerations that may be required for the unknown sludge(s), oily liquids, fibrous materials, etc.

9.0 LIMITATIONS

Kleinfelder has performed this work in accordance with the generally accepted standards of care that exist in the state of Oregon at the time of this assessment. Judgments leading to conclusions and recommendations are generally made with an incomplete knowledge of the subsurface and historical conditions applicable to the study area. More extensive studies including historical review, additional site exploration, soil and groundwater sampling, and chemical analyses may be used to supplement the information presented by this report. Our assessment of the property may also change as new data becomes available during additional site exploration, remediation, or development.

Since site activities and regulations beyond our control could change at any time after the completion of this report, our observations, findings, and opinions can be considered valid only as of the date of the report.

This report may be used only by the City of Troutdale, Eastwind Development, and the DEQ, and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land or facility use, on- and off-site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Any party other than the City of Troutdale, Eastwind Development, and the DEQ who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the City of Troutdale, Eastwind Development or anyone else will release Kleinfelder from any liability resulting

from the use of this report by any unauthorized party and the City of Troutdale and Eastwind Development agree to defend, indemnify, and hold harmless Kleinfelder from any claim or liability associated with such unauthorized use or non-compliance.

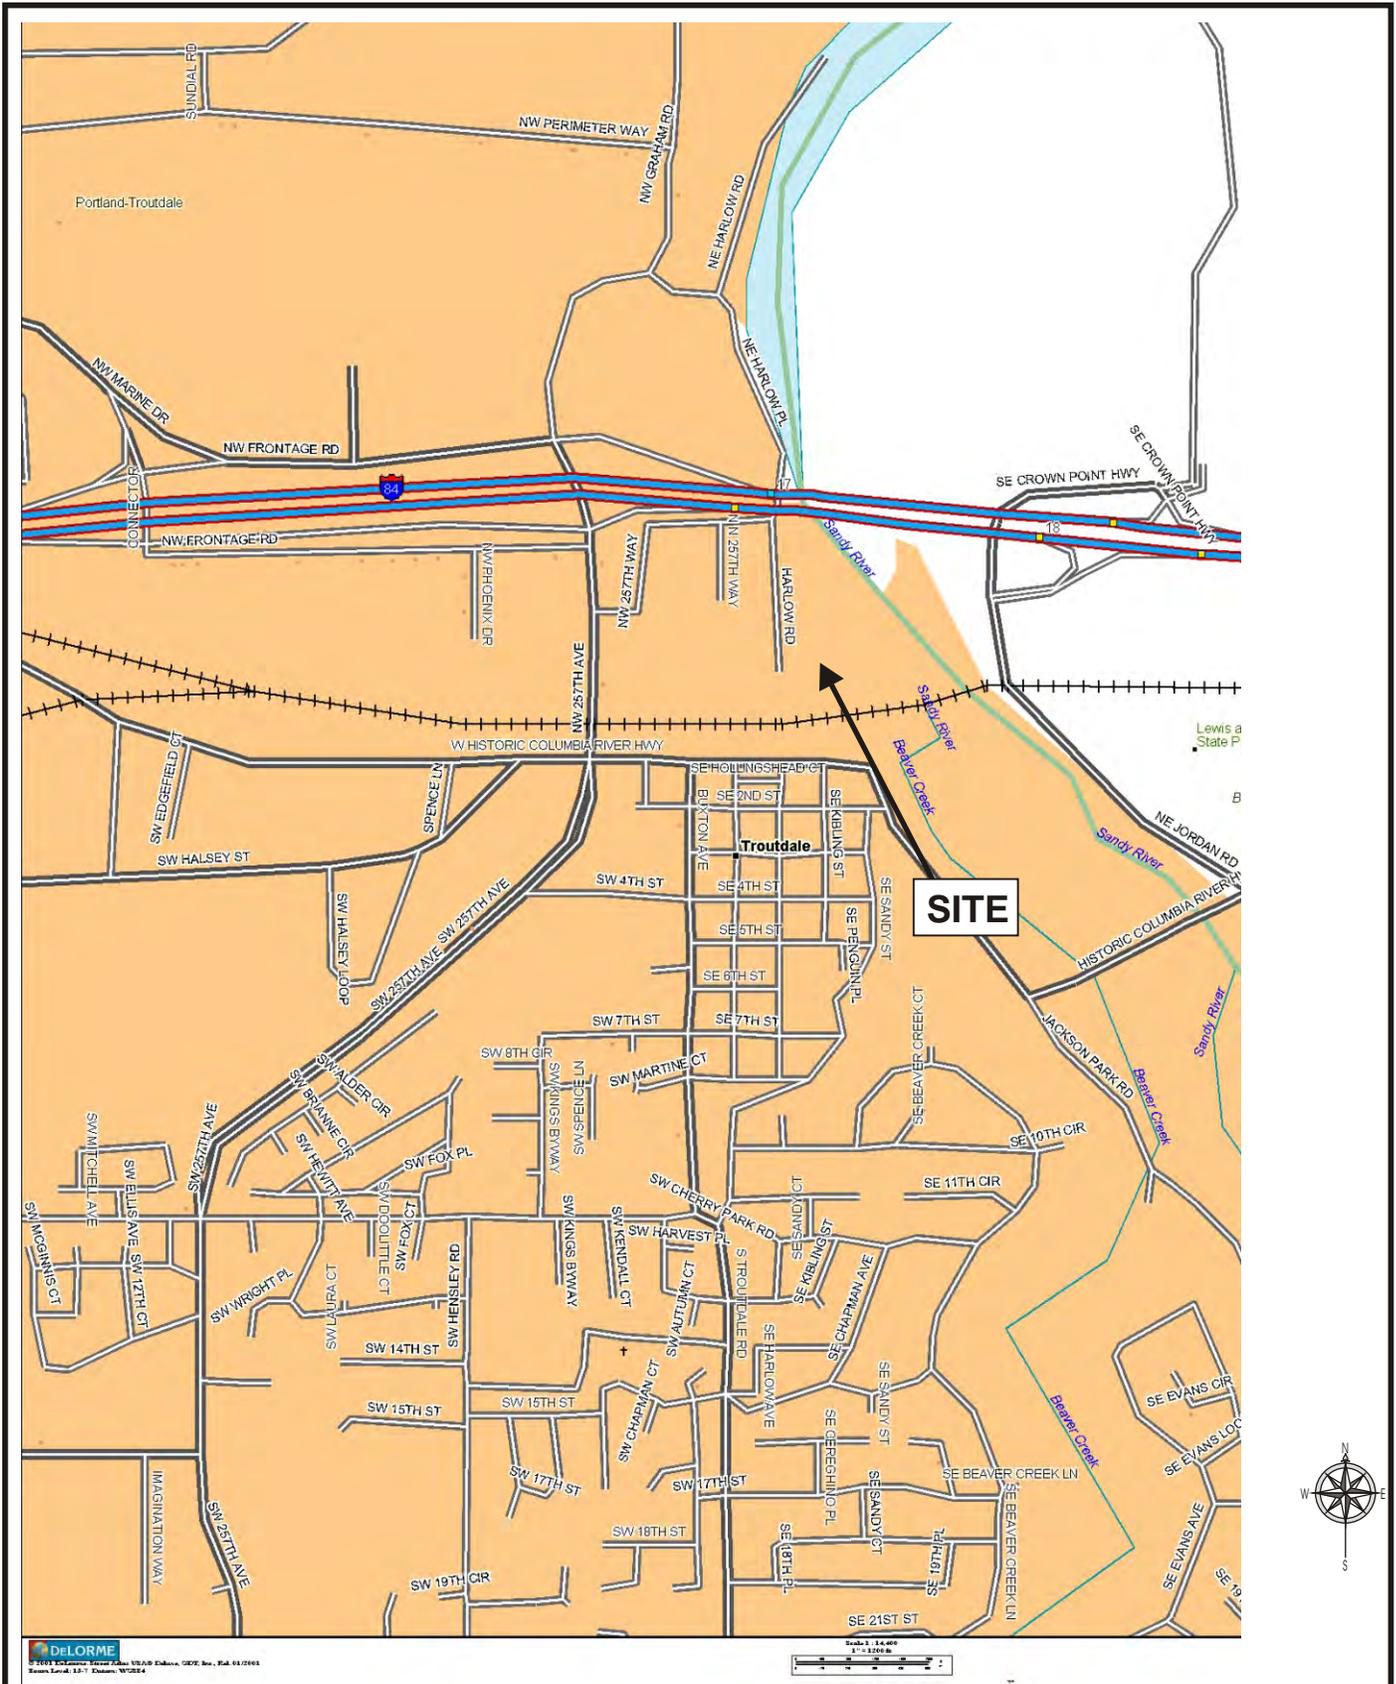

No warranty, expressed or implied, is made.

APPENDIX – MAGNETIC SURVEYS	9
-----------------------------------	---

SUMMARY

A geophysical survey was conducted near the former City of Troutdale water treatment facility. The survey area was historically occupied by the slaughterhouse of Union Meat Company.

A magnetometer survey was conducted in order to detect metallic debris that could be remnants of the foundations of three buildings historically occupying the site, as well as to detect possible drums. Several anomalies were detected with this survey and were investigated with hand-held instruments. Several anomalies were investigated with a backhoe. Most of the anomalies appear to be caused by miscellaneous metallic debris. One anomaly in the southeast corner of the site is typical of a reinforced pad. Hand-held instrument investigation of this anomaly showed that this is probably an area of scattered metallic debris rather than a reinforced concrete pad.

INTRODUCTION

Subsurface mapping surveys are geophysical surveys utilizing geophysical methods and data to detect and locate natural and manmade subsurface features.

A Geonics EM-61 Metal Detector was originally proposed for this survey. This instrument is wheel-driven and because of the uneven ground surface and surface vegetation a Geometrics G-858 Cesium magnetometer was used in its place. The magnetometer is time driven and does not depend upon the rotation of a wheel to collect data. Both instruments are excellent at detecting buried ferrous objects including building foundations, metal tanks and buried drums.

Once suspicious magnetic anomalies are detected, small hand-held metal detectors are used to locate the peaks and edges of the magnetic anomalies.

SURVEY OBJECTIVES

The primary objective of this survey was to detect possible foundations of two former "oil houses" and a large building, all supposedly located to the northeast of the large warehouse located on 302 NW 257th Way. A secondary objective was to detect possible waste drums on the site.

SURVEY SITE

The survey was conducted at the soil-covered area east and north of the large warehouse, located at 302 NW 257th Way, in Troutdale, Oregon (Figure 1).

The area surveyed was approximately 1.2 acres. The site was slightly undulating with some mounds of soil, trees and recently cleared berry bushes. The bushes were cut and flattened, making the ground surface difficult to walk on. The survey site was relatively clear of large surface objects that could interfere with the effectiveness of the magnetic survey. Large metal surface features produce magnetic "noise" that can make the interpretation of magnetic data difficult or impossible. Buried objects of interest located within several feet of a large surface object can be missed. At this site, the warehouse building and power poles created magnetic interference. Other surface features included a debris pile, trees and berry bushes. No surface features indicated the existence of foundations.

TIMING

Jeff Mann and Nikos Tzetos conducted the fieldwork for GeoPotential on March 16, 2006. Messrs. Shawn Rapp and Dominic Norman of Kleinfelder coordinated and the fieldwork.

The report was written by Nikos Tzetos, reviewed by Jeff Mann and emailed in PDF format to Kleinfelder on March 21, 2006.

SURVEY EQUIPMENT AND LIMITATIONS

The following geophysical instruments were used to conduct the survey:

- GEOMETRICS G-858 CESIUM MAGNETOMETER (MAGNETIC SURVEY)
- AQUA -TRONICS A6 ELECTROMAGNETIC TRACER (EMA6 SURVEY)
- SCHONSTEDT GA92XTd MAGNETIC GRADIOMETER (GA92 SURVEY)

This equipment and the procedures used to meet the survey objectives of this project have been proven effective in detecting natural metallic ore bodies and manmade objects such as utilities, USTs and metallic debris.

A magnetometer is a very sensitive electronic instrument capable of detecting minute changes in the earth's local magnetic field. These "magnetic anomalies" are caused by **ferrous** (iron-bearing) objects on or below the ground surface. Surface objects can make the interpretation of a magnetometer survey difficult. A buried object of interest may be missed if it is too close to a large metallic surface object. Common surface objects that present interpretation problems include vehicles, buildings and fences.

The Tracer and Schonstedt hand-held metal detectors are used to locate the peaks of the magnetic anomalies and the edges of buried metallic objects. The Tracer is also excellent at detecting conductive utilities. The Tracer cannot detect non-conductive pipes and utilities however.

Geophysical techniques are excellent at detecting changes in the subsurface caused by natural and manmade objects; however, they are poor at actually identifying subsurface features. Complementary methods may be used to assist in the interpretation; however, the only sure way of identifying a buried feature is by excavation.

PROCEDURE

It was initially proposed to proceed with an electromagnetic survey (EM61) to investigate three separate areas. After inspecting the site it was decided that the undulating surface, covered with thorny "stubble" would be problematic for the EM61 antennas. In addition, the inherently faster magnetic method was chosen since the survey area had to be expanded because the three areas of interest could not be accurately located.

A right-hand orthogonal survey grid was established on the site using a measuring wheel and tapes. The origin (0,0) of the survey grid was located at the southwestern corner of the site, as shown in Figure 2. All geographic features shown on the accompanying map are measured from the origin.

Magnetic data were collected automatically at approximately 6-inch intervals along parallel traverses measured to be 5 feet apart. Data were downloaded to a laptop computer and processed in the field. Lastly, a contour map of the data was printed.

Figure 2 is a colored magnetic contour map contoured at an interval of 100 nT, an interval sufficient to detect rebar in concrete and other foundation debris. Magnetic "lows" are generally caused by objects located above the magnetometer sensor (normally carried about 3 feet high) and are shown in blue, and may also be hachured. At this site magnetic "lows" are produced by the warehouse building and the power poles and their supports. Magnetic "highs", shown in red, are generally produced by ferrous objects below the sensor and are of most importance since pipes, foundation debris, utilities and drums produce magnetic highs. A "high/low" pair of anomalies may be produced by buried objects depending upon the size, shape, and orientation of the buried object with respect to the earth's local magnetic field, and the depth of burial

of the object. Not all magnetic lows are shown in blue. The transition point from high (red) to low (blue) is arbitrary and can be adjusted. Its main use is to differentiate between highs and lows.

Anomalies produced by buried metallic objects were located on the site using a measuring wheel and were labeled on the contour map for further exploration using the other geophysical instruments. The magnetic anomaly peaks and the edges of the buried metallic objects causing them were then located using the Tracer and Schonstedt hand-held metal detectors.

A backhoe was available to excavate anomalous areas.

RESULTS

The Sanborne Maps provided by Kleinfelder showed several of the old slaughterhouse buildings dating back to circa 1900, including the "target" buildings. The more up to date aerial photographs showed newer buildings including the existing warehouse. Unfortunately, possible landmarks that could be used to locate the approximate locations of the "target" buildings could not be identified and the scope of the survey was altered to include a larger area. It is possible that the "target" building foundations are located outside of the survey site.

Eleven magnetic anomalies were detected with the survey and are shown in Figure 2 as A to K. Results were marked on the surface with orange flags. Based upon the magnetic survey and handheld instruments, no obvious foundation anomalies were detected with this survey.

Magnetic anomaly A is interpreted to be caused by a small metallic object that may be a drum or other metallic debris.

Magnetic anomaly B is located north of A and is also interpreted to be caused by a small metallic object. It is located within an approximately 80-foot by 50-foot area containing conductive metal (non-ferrous) discovered with the Tracer. Later excavation of B unearthed a concrete pad overlaying a malodorous soil zone also containing oil. It is believed that this may be the location of one of the two "oil houses".

Magnetic anomaly C was also determined to be within a conductive zone although smaller than B, which when excavated, showed similar characteristics without the oil.

Magnetic anomaly D is within an anomalous zone that shows abrupt edges and has the characteristic anomaly pattern of a reinforced pad; however, when explored with the Tracer, this zone did not appear to be a pad, but appeared to be composed of numerous distinct metallic objects. When investigated with the Schonstedt hand-held magnetic gradiometer it appeared to be a pad. It is possible that this area is a broken up foundation pad or a debris zone.

Anomalies E, G H and I appear to be caused by small metallic objects that may be debris or drums.

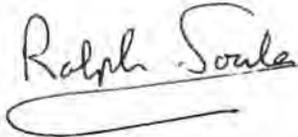

Anomaly F is interpreted to be caused by a metallic debris zone. It was excavated during this survey and was found to be caused by scattered drywall nails.

Anomaly J appeared scattered with the hand-held instruments and did not show a definite shape with the Tracer. It is interpreted to be caused by small and scattered metallic objects.

Anomaly K also appeared to contain scattered metallic objects with the handheld instruments, showing one distinct magnetic high peak and a separate Tracer high peak. When excavated during the survey, it appeared to be caused by miscellaneous metallic debris, and possibly pieces of a crushed drum under the Tracer high peak.

LIMITATIONS

Geophysical surveys consist of interpreting geophysical responses from subsurface features. Since a variety of subsurface features can produce identical geophysical responses, it is necessary to confirm the geophysical interpretation with intrusive investigations such as excavating or drilling. In addition, many subsurface features may produce no geophysical response. The use of this subsurface mapping survey is the sole responsibility of the client.

APPENDIX MAGNETOMETER SURVEYS

The earth's magnetic field, measured in "nano Teslas" (nT), behaves like a bar magnet, with the strongest magnetic field located at the poles, and the weakest field located near the equator. In the United States, the average field intensity varies widely; however, the average value is about 50,000 nT. Also, like the magnetic field around the bar magnet, the earth's magnetic field is inclined. This inclination varies between 60 and 75 degrees, generally depending upon the latitude of the measuring location. The earth's magnetic field varies constantly and, during sunspot activity, quite dramatically. A magnetometer is an electronic device that measures the intensity of the earth's magnetic field.

Naturally occurring geologic features and buried ferrous metal objects such as underground storage tanks, drums, ordnance, pipes and debris filled trenches produce both horizontal and vertical disturbances to the earth's local magnetic field. The objects causing these "anomalies" can be detected quickly and reliably using portable magnetometers.

The intensity of an anomaly is a function of the mass, size and depth of burial of the object. As a rule of thumb, single drums buried several feet below the surface produce anomalies of about 200 nT relative to the normal undisturbed background and can be detected at a horizontal distance of about 15 feet, while large caches of drums can produce anomalies of many thousands of nT and may be detectable 50 feet away.

Magnetometers generally measure horizontal variations in the local magnetic field. A magnetic gradiometer is a variant of the magnetometer that measures both the horizontal and the vertical magnetic field at each survey point. It consists of two identical sensors located vertically on a staff and having a fixed separation. The intensity of the magnetic field caused by a buried metal object varies inversely with the distance between the object and the sensor. The relative intensities measured simultaneously at each sensor are used to determine the relative depth of burial of an object.

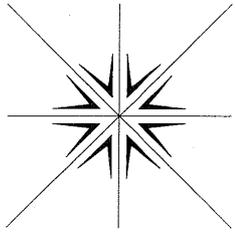

Relative depth estimates of buried metal objects can be made using a single sensor. In general, for a given mass object, the deeper the object is buried, the lower the amplitude and the wider the anomaly. Shallowly buried objects produce higher amplitude anomalies with closely spaced contour lines.

Magnetic surveys can only detect **ferrous metal** objects and cannot be used to identify the buried object. Estimates of the total mass of a buried object are difficult due to the physical properties of the object and other factors. Interference caused by observed surface metal objects limits the accuracy of the survey. The anomalies produced by fences, power lines, cars and buildings can easily mask the anomaly caused by an underground target.

Magnetic surveys are cost effective. Using the standard "step and wait" magnetometer, data from approximately 1000 points can be obtained in one field day corresponding to between 1 acre and about 5 acres depending on site conditions and survey goals. More modern cesium magnetometers collect up to 10 readings per second continuously, thus the operator can proceed without stopping. Many modern magnetometers use an audible signal to call attention to anomalous data as it is obtained. At some sites metallic objects can be detected and marked in the field at the time of the survey.

The use of a second, automatically recording "base station" magnetometer is highly recommended due to temporal variations in the earth's magnetic field. These changes must be removed from the field data before an accurate interpretation can be made, particularly when searching for small-buried objects.

Magnetic data are most commonly presented in two contour maps. The TOTAL MAGNETIC FIELD CONTOUR MAP shows the horizontal magnetic field and, therefore, the areal extent of anomalies. The GRADIOMETER CONTOUR MAPS show the vertical magnetic field and indicate the relative depth of burial of the objects causing those anomalies. Color versions of these maps may be produced showing only the magnetic highs and lows.

RE: City of Troutdale

Dear Shawn Rapp:

Order No.: 0603087

Specialty Analytical received 16 samples on 3/20/2006 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Ned Engleson
Project Manager

ANALYTICAL QC SUMMARY REPORT

TestCode: NWTPHDX_S

Sample ID	CCV	SampType:	CCV	TestCode:	NWTPHDX_S	Units:	mg/Kg	Prep Date:		Run ID:	GC-M_060323B		
Client ID:	ZZZZZ	Batch ID:	15421	TestNo:	NWTPH-Dx			Analysis Date:	3/23/2006	SeqNo:	381078		
Analyte		Result		PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	RPD Ref Val	%RPD	RPDLimit	Qual
Diesel		374		15.0	400	0	93.5	85	115	0		0	
Lube Oil		296.3		50.0	266.6	0	111	85	115	0		0	

Qualifiers: ND - Not Detected at the Reporting Limit S - Spike Recovery outside accepted recovery limits B - Analyte detected in the associated Method Blank
 J - Analyte detected below quantitation limits R - RPD outside accepted recovery limits

KEY TO FLAGS

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards.
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- B The blank exhibited a positive result greater than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- H Sample was analyzed outside recommended hold time.
- HT At clients request, sample was analyzed outside recommended hold time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- N Gasoline result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- P Detection levels of Methylene Chloride may be laboratory contamination, due to previous analysis or background levels.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits, post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.
